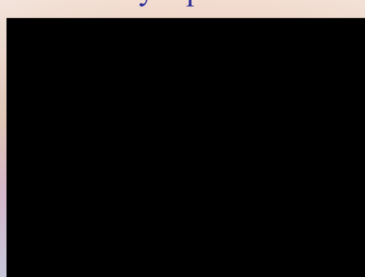
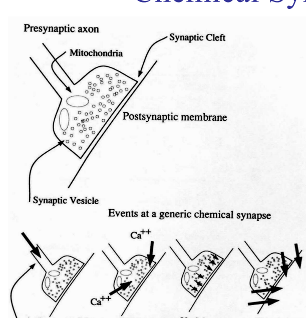
Synapses



video by Hybrid Medical Animation

1/18/17 COSC 494/594 CCN 5

Chemical Synapse



1. Action potential arrives at synapse
2. Opens Ca ion channels and Ca^{++} ions enter cell
3. Vesicles move to membrane, release neurotransmitter
4. Transmitter crosses cleft, causes postsynaptic voltage change

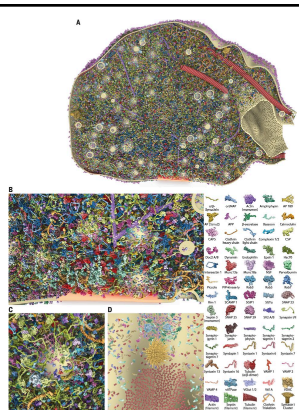

Fig. 3: A 3D model of synaptic architecture.

- A section through the synaptic bouton, indicating 60 proteins.
- High-zoom view of the active zone area.
- High-zoom view of one vesicle within the vesicle cluster.
- High-zoom view of a section of the plasma membrane in the vicinity of the active zone. Clusters of syntaxin (yellow) and SNAP 25 (red) are visible, as well as a recently fused synaptic vesicle (top). The graphical legend indicates the different proteins (right). Displayed synaptic vesicles have a diameter of 42 nm.

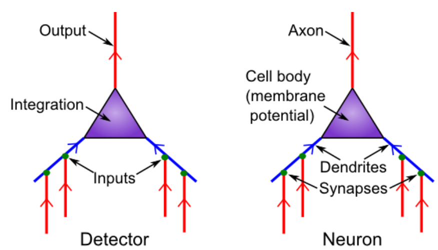
Detector Model



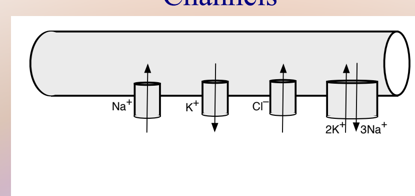
1/18/17 COSC 494/594 CCN 16
(slide from O'Reilly)

Overall Strategy

- Neurons are electrical systems, can be described using basic electrical equations.
- Use these equations to simulate on a computer.
- Need a fair bit of math to get a full working model (more here than most chapters), but you only really need to understand conceptually.

1/18/17 (slide from O'Reilly) COSC 494/594 CCN 17

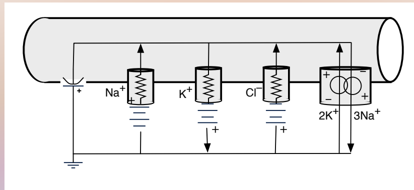
Membrane Potential: Channels



- Na-K pump ⇒ intracellular negative
- Na^+, K^+, Cl^- diffusing through their channels
- create potentials across channels

1/18/17 COSC 494/594 CCN 18

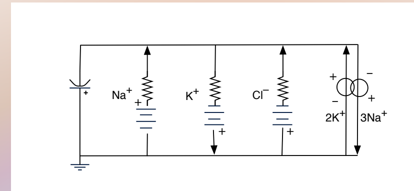
Membrane Potential: Channels & Equivalent Circuit



- Open channels define resistance to ion flow
- Membrane acts like insulator
- Ion pump charges membrane capacitance

1/18/17 COSC 494/594 CCN 19

Membrane Potential: Equivalent Circuit

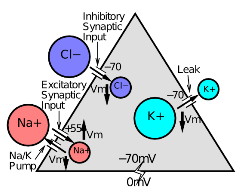


- Ion pump is constant
- Change in conductance of channels
- ⇒ change in membrane potential

1/18/17 COSC 494/594 CCN 20

Neurophysiology of Membrane

- Na-K pump pumps Na^+ out of the neuron and pumps a lesser amount of K^+ into the neuron
- Creates negative resting potential (–70 mV)
- Na^+ wants in (can't, due to closed channels)
- Cl^- is in balance (diffusion pushes in, electrical pushes out)
- K^+ is in balance (diffusion pushes out, electrical pushes in)



1/18/17 COSC 494/594 CCN 21

Ions Summary

- Excitatory synaptic input boosts the membrane potential by allowing Na+ ions to enter the neuron (depolarization)
- Inhibitory synaptic input serves to counteract this increase in membrane potential by allowing Cl^- ions to enter the neuron
- The leak current (K^+ flowing out of the neuron through open channels) acts as a drag on the membrane potential. Functionally speaking, it makes it harder for excitatory input to increase the membrane potential.

(slide based on Frank)

1/18/17 COSC 494/594 CCN 22

Input Signals

- Excitatory
  - about 85% of inputs
  - AMPA channels, opened by glutamate
- Inhibitory
  - about 15% of inputs
  - GABA channels, opened by GABA
  - produced by inhibitory interneurons
- Leakage
  - potassium channels
- Synaptic efficacy (weight) is net effect of:
  - presynaptic neuron to produce neurotransmitter
  - postsynaptic channels to bind it

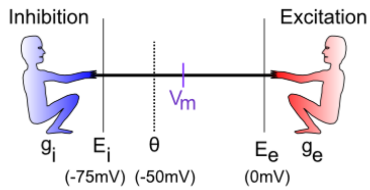
1/18/17 COSC 494/594 CCN 23

Membrane Potential (Variables)

- g_e = excitatory conductance
- E_e = excitatory potential (~ 0 mV)
- g_i = inhibitory conductance
- E_i = inhibitory potential (–70 mV)
- g_l = leakage conductance
- E_l = leakage potential
- V_m = membrane potential
- θ = threshold

1/18/17 COSC 494/594 CCN 24

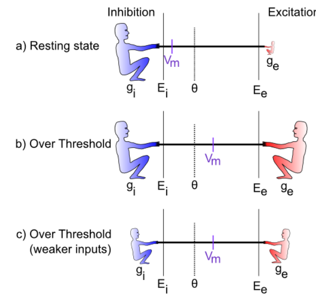
The Tug-of-War



How strongly each guy pulls: $I = g\,(E - V_m)$
g = how many input channels are open
E = driving potential (pull down for inhibition, up for excitation)
V_m = the "flag" – reflects net balance between two sides

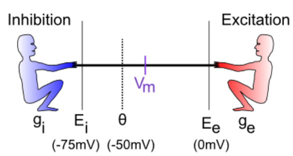
1/18/17 COSC 494/594 CCN 25
(slide from O'Reilly)

Relative Balance



1/18/17 COSC 494/594 CCN 26
(slide from O'Reilly)

Equations



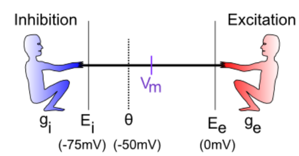
$$I_{net} = I_e + I_i + I_l = g_e\,(E_e - V_m) + g_i\,(E_i - V_m) + g_l\,(E_l - V_m)$$

$$V_m\,(t) = V_m\,(t-1) + dt_{vm} I_{net}$$

$$V_m(t) = V_m(t-1) + dt_{vm}\,[g_e(E_e - V_m) + g_i(E_i - V_m) + g_l(E_l - V_m)]$$

1/18/17 COSC 494/594 CCN 27
(slide from O'Reilly)

Equilibrium



$$V_m = \frac{g_e}{g_e + g_i + g_l} E_e + \frac{g_i}{g_e + g_i + g_l} E_i + \frac{g_l}{g_e + g_i + g_l} E_l$$

This is just the balance of forces

1/18/17 COSC 494/594 CCN 28
(slide from O'Reilly)

Input Conductances and Weights

- Just add them up (and take the average)

$$g_e(t) = \frac{1}{n} \sum_i x_i w_i$$

- Key concept is *weight:* how much unit listens to given input
- Weights determine what the neuron detects
- Everything you know is encoded in your weights

1/18/17 COSC 494/594 CCN 29
(slide from O'Reilly)

Generating Output

- If V_m gets over threshold, neuron fires a spike
- Spike resets membrane potential back to rest
- Has to climb back up to threshold to spike again

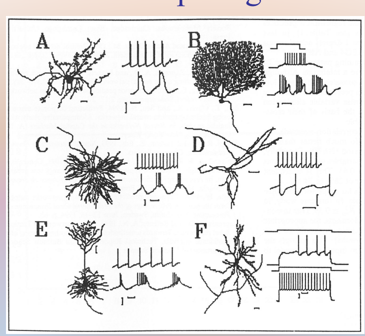
Variations in Spiking Behavior



1/18/17 COSC 494/594 CCN 35

Computational Formulation

1/18/17 COSC 494/594 CCN 36

Membrane Potential

Currents: $I_x = g_x(E_x - V_m), \;\; x = e, i, l$

Net current: $I_{net} = I_e + I_i + I_l$

Change in membrane potential: $\dot{V}_m = C^{-1} I_{net}$ (C^{-1} is rate constant)

$$\dot{V}_m = C^{-1}[g_e(E_e - V_m) + g_i(E_i - V_m) + g_l(E_l - V_l)]$$

$$\text{Equilibrium } V_m = \frac{g_e E_e + g_i E_i + g_l E_l}{g_e + g_i + g_l}$$

1/18/17 COSC 494/594 CCN 37

Relative vs. Absolute Conductances

- Previously, g_x was absolute conductance (measured in nanosiemens)
- More convenient to represent as product $\bar{g}_x \, g_x(t)$
  - — where $\bar{g}_x$ is the absolute maximum conductance (all channels open)
  - — and $g_x(t)$ is the relative conductance at a given time, $0 \le g_x(t) \le 1$

$$V_m = \frac{\bar{g}_e g_e(t)}{\bar{g}_e g_e(t) + \bar{g}_i g_i(t) + \bar{g}_l} E_e + \frac{\bar{g}_i g_i(t)}{\bar{g}_e g_e(t) + \bar{g}_i g_i(t) + \bar{g}_l} E_i + \frac{\bar{g}_l}{\bar{g}_e g_e(t) + \bar{g}_i g_i(t) + \bar{g}_l} E_l$$

1/18/17 COSC 494/594 CCN 38

Discrete Spiking

if Vm > θ then
    y := 1;
    Vm := Vm_r;
else y := 0;

1/18/17 COSC 494/594 CCN 39

Rate Code Approximation

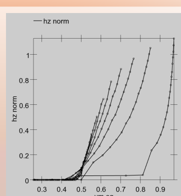
- Brain likes spikes, but rates are more convenient
  - — Instantaneous and steady – smaller, faster models
  - — But definitely lose several important things
  - — Solution: do it both ways, and see the differences
- Goal: equation that makes good approximation of actual spiking rate for same sets of inputs

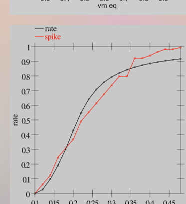
(slide based on O'Reilly)

1/18/17 COSC 494/594 CCN 40

Rate Code Approximation

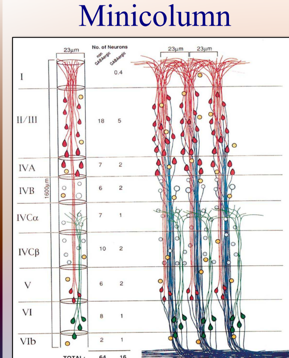
- Rate-coded (simulated) neurons:
  - short-time avg spike frequency ≈
  - avg behavior of minicolumn (~100 neurons) with similar inputs and output behavior
- Rate not predicted well by V_m
- Predicted better by g_e relative to a threshold value g_e^θ





1/18/17 COSC 494/594 CCN 41

Minicolumn



- Up to ~100 neurons
  - 75–80% pyramidal
  - 20–25% interneurons
- 20–50μ diameter
- Length: 0.8 (mouse) to 3mm (human)
- ~ 6×10^5 synapses
- 75–90% synapses outside minicolumn
- Interacts with 1.2×10^5 other minicolumns
- Mutually excitable
- Also called *microcolumn*

1/18/17 42

Rate Code Approximation

- g_e^θ is the conductance when $V_m = \theta$
- Rate is a nonlinear function of relative conductance
- What is f?

$$\theta = \frac{g_e^\theta E_e + g_i E_i + g_l E_l}{g_e^\theta + g_i + g_l}$$

$$g_e^\theta = \frac{g_i(E_i - \theta) + g_l(E_l - \theta)}{\theta - E_e}$$

$$y = f(g_e - g_e^\theta)$$

1/18/17 COSC 494/594 CCN 43

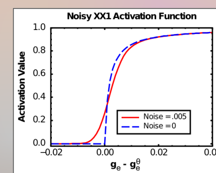
Activation Function

- Desired properties:
  - threshold (~0 below threshold)
  - saturation
  - smooth
- Smooth by convolution with Gaussian to account for noise
- Activity update:

$$y_{t+1} = y_t + C(y - y_t)$$

$$y = \frac{x}{x+1} \quad \text{where} \quad x = \eta\left[g_e - g_e^\theta\right]^+$$

$$y = \frac{1}{1 + \frac{1}{\eta\left[g_e - g_e^\theta\right]^+}}$$

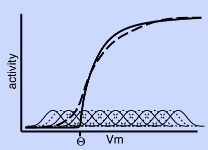


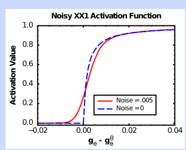
1/18/17 COSC 494/594 CCN 44

Gaussian Smoothing

X-over-X-plus-1 has a very sharp threshold

Smooth by *convolve* with noise (like "blurring" or "smoothing"):





$$y^*(x) = \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}\sigma} e^{-z^2/(2\sigma^2)} y(z - x)\, dz$$

(slide based on Frank)

1/18/17 COSC 494/594 CCN 45

Approximating Continuous Dynamics

- V_m changes gradually when input changes
- Firing rate $y(t)$ should also change gradually (subject to a time constant)
- Discrete-time update equation:

$$y(t) = y(t-1) + dt_{vm}\,(y^*(x) - y(t-1))$$
