

Embodiment and Non-Turing Computation

Bruce MacLennan
 Dept. of Electrical Eng. & Computer Science
 University of Tennessee, Knoxville

2008-07-12

NA-CAP 2008

1

Post-Moore's Law Computation

- The end of Moore's Law is in sight!
- Physical limits to:
 - density of binary logic devices
 - speed of operation
- Requires a new approach to computation
- Significant challenges
- Will broaden & deepen concept of computation in natural & artificial systems

2008-07-12

NA-CAP 2008

2

Differences in Spatial Scale

2008-07-12

NA-CAP 2008
 (Images from Wikipedia)

3

Differences in Time Scale

2008-07-12

NA-CAP 2008
 (Images from Wikipedia)

4

Convergence of Scales

2008-07-12

NA-CAP 2008

5

Implications of Convergence

- Computation on scale of physical processes
- Fewer levels between computation & realization
- Less time for implementation of operations
- Computation will be more like underlying physical processes
- Post-Moore's Law computing \Rightarrow greater assimilation of computation to physics

2008-07-12

NA-CAP 2008

6

Computation is Physical

“Computation is physical; it is necessarily embodied in a device whose behaviour is guided by the laws of physics and cannot be completely captured by a closed mathematical model. This fact of embodiment is becoming ever more apparent as we push the bounds of those physical laws.”

— Susan Stepney (2004)

2008-07-12

NA-CAP 2008

7

Cartesian Duality in CS

- Programs as idealized mathematical objects
- Software treated independently of hardware
- Focus on *formal* rather than *material*
- Post-Moore's Law computing:
 - less idealized
 - more dependent on physical realization
- More difficult
- But also presents opportunities...

2008-07-12

NA-CAP 2008

8

Embodied Cognition

- Rooted in pragmatism of James & Dewey
- Dewey's *Principle of Continuity*:
 - no break from most abstract cognitive activities
 - down thru sensory/motor engagement with physical world
 - to foundation in biological & physical processes
- Cognition: emergent pattern of purposeful interactions between organism & environment

2008-07-12

NA-CAP 2008

9

Embodiment, AI & Robotics

- Dreyfus & al.:
 - importance & benefits of embodiment in cognition
 - there are many things we know merely by virtue of having a body
 - embodiment essential to cognition,
 - not incidental to cognition (& info. processing)
- Brooks & al.: increasing understanding of value & exploitation of embodiment in AI & robotics

2008-07-12

NA-CAP 2008

10

Embodied Computation

2008-07-12

NA-CAP 2008

11

Embodiment & Computation

- Embodiment = “the interplay of information and physical processes”
 - Pfeifer, Lungarella & Iida (2007)
- *Embodied computation* = information processing in which physical realization & physical environment play unavoidable & essential role

2008-07-12

NA-CAP 2008

12

Three Modes of Computation

- Offline computation
- Embedded computation
- Embodied computation

2008-07-12

NA-CAP 2008

13

Offline Computation

- Physical input conv. to computational medium
- Abstract computation
- Physical representation of results
- Computation as evaluation of function

2008-07-12

NA-CAP 2008
(Images from Wikipedia)

14

Embedded Computation

- In ongoing interaction with environment
- Non-terminating
- Real-time feedback through environment

2008-07-12

NA-CAP 2008
(Images from Wikipedia)

15

Embedded Computation

- Sensors & actuators still convert to/from computational medium
- Computation is effectively abstract
- Physical considerations confined to:
 - embedding device
 - environment
 - transducers
 - basic physical characteristics of processor

2008-07-12

NA-CAP 2008

16

Embodied Computation

- Embodied (vs embedded) computation:
 - little or no abstract computation
 - computation as physical process in continuing interaction with other physical processes

2008-07-12

NA-CAP 2008
(Images from Wikipedia)

17

Strengths of Embodied Computation

- Information often implicit in:
 - its physical realization
 - its physical environment
- Many computations performed "for free" by physical substrate
- Representation & info. processing emerge as regularities in dynamics of physical system

2008-07-12

NA-CAP 2008

18

Example: Diffusion

- Occurs naturally in many fluids
- Can be used for many computational tasks
 - broadcasting info.
 - massively parallel search
- Expensive with conventional computation
- Free in many physical systems

2008-07-12

NA-CAP 2008

19

Example: Saturation

- Sigmoids in ANNs & universal approx.
- Many physical sys. have sigmoidal behavior
 - Growth process saturates
 - Resources become saturated or depleted
- EC uses free sigmoidal behavior

2008-07-12

NA-CAP 2008
(Images from Bar-Yam & Wikipedia)

20

Example: Negative Feedback

- Pos. feedback for growth & extension
- Neg. feedback for:
 - stabilization
 - delimitation
 - separation
 - creation of structure
- Free from
 - evaporation
 - dispersion
 - degradation

2008-07-12

NA-CAP 2008

21

Example: Randomness

- Many algs. use randomness
 - escape from local optima
 - symmetry breaking
 - deadlock avoidance
 - exploration
- For free from:
 - noise
 - uncertainty
 - imprecision

2008-07-12

NA-CAP 2008
(Image from Anderson)

22

“Respect the Medium”

- Conventional computer technology “tortures the medium” to implement computation
- Embodied computation “respects the medium”
- Goal of embodied computation:

Exploit the physics, don't circumvent it

2008-07-12

NA-CAP 2008

23

Computation for Physical Purposes

2008-07-12

NA-CAP 2008

24

EC for Action

- EC uses physics for information processing
- Inf. system governs matter & energy in physical computer
- EC uses info. proc. to govern physical proc.

2008-07-12 NA-CAP 2008 25

EC for Action

- Natural EC:
 - governs physical processes in organism's body
 - physical interactions with other organisms & environment
- Often, result of EC is not *information*, but *action*, including:
 - self-action
 - self-transformation
 - self-construction

2008-07-12 NA-CAP 2008 26

Disembodied Computation

- *If* purpose is information processing
- *Then* represent information with small quantities of matter or energy
- Objective: state change involves small change of matter or energy
- Limit: *disembodied* computation & communication
- Pure *form* without need for *matter*

2008-07-12 NA-CAP 2008 27

EC Controlling Matter & Energy

- May want to move *more* rather than *less*
- Physical effects may be direct results of computation
- No clear distinction between processors & actuators
- Examples:
 - Algorithmic assembly by DNA computation (Winfree)
 - Nanostructure synth. & control by molecular combinator reduction (MacLennan)

(figure from Rothemund)

2008-07-12 NA-CAP 2008 28

Active Materials

- EC may be applied to active materials
- E.g., artificial tissue that can
 - recognize environmental conditions
 - open or close channels controlling transport
 - react mechanically (e.g., contraction)
 - self-organize

2008-07-12 NA-CAP 2008 29

Artificial Morphogenesis

- Morphogenesis \Rightarrow EC can coordinate:
 - proliferation
 - movement
 - disassembly
- to produce complex, hierarchical systems
- Future nanotech.: use EC for multiphase self-org. of complex, functional, active hierarchical systems

(Images from Wikipedia)

2008-07-12 NA-CAP 2008 30

Natural Computation

- Challenge of EC: little experience with it
- Nature provides many examples of effective EC
- Nature shows how computation can
 - exploit physics
 - without opposing it
- Shows how information processing systems can interact fruitfully with physical embodiment of selves & other systems

2008-07-12

NA-CAP 2008

31

Design of Emergent Computation Systems

(1) Understand

(2) Abstract

(3) Realize

2008-07-12

NA-CAP 2008

32

(1) Understand

- Understand how information processing occurs & interacts with physical reality in natural systems
- Look to studies of specific systems relevant to intended application
- Also look to more general information about embodied computation in nature

2008-07-12

NA-CAP 2008

33

(2) Abstract

- Abstract process from physical specifics
 - may amount to a mathematical model
 - but is not disembodied
- Physical processes not ignored, but included in essential form
- E.g., diffusion:
replace *specific* quantity by *generic* quantity
- Some processes will be more generally useful than others

2008-07-12

NA-CAP 2008

34

(3) Realize

- Realize abstract computation in appropriate medium by selecting:
 - substances
 - forms of energy
 - quantities
 - processes
 - etc.
- More difficult than traditional computing
- But necessary in post-Moore's Law era

2008-07-12

NA-CAP 2008

35

General Design Principles

- Natural EC suggests computational primitives that are:
 - generally useful
 - realizable in a variety of media
- EC for morphogenesis:
 - *discrete primitives*: individual elements
 - *continuous primitives*: spatial masses of them
 - *coordinated algorithms*: temporal organization

2008-07-12

NA-CAP 2008

36

“Discrete Primitives”

- Physical processes involving single elements, responding passively or actively
- Examples:
 - mobility (translation, rotation)
 - adhesion & release
 - shape change
 - differentiation or state change
 - collision & interaction
 - proliferation & apoptosis

2008-07-12

NA-CAP 2008

37

“Continuous Primitives”

- Physical processes pertaining to spatially distributed masses of elementary units
- Examples:
 - elasticity
 - diffusion
 - degradation
 - fluid flow
 - gradient ascent

2008-07-12

NA-CAP 2008

38

Coordinated Algorithms

- Biological morphogenesis ⇒ EC organizes complex, multistage processes operating in parallel at microscopic and macroscopic levels
- Coordinated algorithms in wasp nest construction (Bonabeau, Dorigo & Theraulaz)
- Sequential, parallel, or overlapping
- What are the principles of coordinated algorithm design for EC?

2008-07-12

NA-CAP 2008

39

But is it Computing?

2008-07-12

NA-CAP 2008

40

Is EC a Species of Computing?

- The Turing Machine provides a precise definition of computation
- Embodied computation may seem imprecise
- & difficult to discriminate from other physical processes
- Expanding concept of computation beyond TM requires an expanded definition

2008-07-12

NA-CAP 2008

41

What is Computation?

- What distinguishes computing (physically realized information processing) from other physical processes?
- Computation is a *mechanistic process*, the purpose or function of which is the *abstract manipulation* (processing) of *abstract objects*
- Purpose is *formal* rather than *material*
- Does not exclude embodied computation, which relies more on physical processes

2008-07-12

NA-CAP 2008

42

Material Effects Inherent to EC

- Goal of EC may be specific material effects
- But can be understood abstractly
- Example: activator-inhibitor system
 - produces characteristic “Turing patterns”
 - can be characterized mathematically
- May be degrees of computational/non-comp.
- May be degrees of essential embodiment vs. independence of specific phys. realization

2008-07-12

NA-CAP 2008

43

Nature Combines Functions

- Artificial systems often have clear purposes
- Nature often combines multiple functions into one system
- Example: ant foraging brings food to nest
- But also does computational tasks:
 - adaptive path finding
 - path minimization
 - exploration

2008-07-12

NA-CAP 2008

44

Shanley Principle

- Well-engineered artificial systems obey *Shanley Principle*: multiple functions should be combined into single parts
- Orthogonal design is important in prototyping
- But should be followed by integration of function (Knuth)
- Pushing limits of tech. & deeper embedding
 - will have to combine functions
 - inf. processing systems will be less purely computational & more essentially embodied

2008-07-12

NA-CAP 2008

45

Related Work: Hamann and Wörn (2007)

- An EC system has at least two levels
 - adaptive SO & collective behavior at higher levels results from
 - spatially local interactions of “microscopic control devices”
- aspects of embodiment:
 - lack of separation between processor and memory
 - essential dependence of computation on physical world
- Seems to conflate embodiment with other issues

2008-07-12

NA-CAP 2008

46

Related Work: Susan Stepney (in press)

- Material computation and in materio computers
- Systems in which physical substrate “naturally” computes
- Focus on non-living substrates
- Primarily concerned with use of physical materials to implement computations
- Less concerned with use of computational processes to organize & control matter and energy
- Cautions against ill-advised application of notions from Turing computation

2008-07-12

NA-CAP 2008

47

Non-Turing Computation

2008-07-12

NA-CAP 2008

48

Frames of Relevance

- CT computation is a *model* of computation
- All models have an associated *frame of relevance*
 - determined by model's simplifying assumptions
 - by aspects & degrees to which model is similar to modeled system
- Determine questions model is suited to answer
- Using outside FoR may reflect model & simplifying assumptions more than modeled system

2008-07-12

NA-CAP 2008

49

FoR of CT Model

- CT computation developed to address issues in effective calculability & formalist mathematics
- In FoR makes sense to consider something computable if it can be computed in
 - finite number of steps
 - of finite but indeterminate duration
 - using finite (but unbounded) amount of memory
- Makes sense to treat computation as function evaluation
- And define computability in terms of sets of functions

2008-07-12

NA-CAP 2008

50

Unsuitability to EC

- CT model is not well-suited to address relevant issues in EC (or in natural computation)
- Its simplifications & approximations are bad ones for EC
- E.g., CT model ignores real-time rates of operations, but they are highly relevant in EC
- Also, CT notions of equivalence & universality do not address the efficiency with which one system simulates another

2008-07-12

NA-CAP 2008

51

Frame of Relevance for EC

- Premature to define model of embodied computation
- We do not yet understand which issues are relevant or not
- Premature formalization can impede progress
- Some relevant issues:
 - robustness
 - generality
 - flexibility
 - adaptability
 - morphology & steric constraints
 - physical size
 - consumption of matter & energy
 - reversible reactions
 - real-time response

2008-07-12

NA-CAP 2008

52

Conclusions

- Embodied computation will be important in post-Moore's Law computing
- But need new models of computation that:
 - are orthogonal to CT model
 - but address relevant issues of EC
- There will be a fruitful interaction between investigations of embodiment in computation and philosophy

2008-07-12
