

# ECE 472/572 - Digital Image Processing

## Lecture 3 - Image Enhancement - Point Processing

08/30/11

---

---

---

---

---

---

---

---

# Roadmap

- \* Introduction
  - Image format (vector vs. bitmap)
  - IP vs. CV vs. CG
  - HLIP vs. LLIP
  - Image acquisition
- \* Perception
  - Structure of human eye
    - rods vs. cones (Scotopic vision vs. photopic vision)
    - Fovea and blind spot
    - Flexible lens (near-sighted vs. far-sighted)
  - Brightness adaptation and Discrimination
    - Weber ratio
    - Dynamic range
  - Image resolution
    - Sampling vs. quantization
- \* Image enhancement
  - Enhancement vs. restoration
  - Spatial domain methods
    - Point-based methods
      - Negative
      - Log transformation
      - Power-law
      - Contrast stretching
      - Gray-level slicing
      - Bit plane slicing
      - Histogram equalization
      - Averaging
    - Mask-based (neighborhood-based) methods - spatial filter
  - Frequency domain methods

2

---

---

---

---

---

---

---

---

# Questions

- \* Point-based vs. Mask-based (or neighbor-based)
- \* Spatial domain vs. Frequency domain
- \* Log transformation vs. Power-law
  - Gamma correction
  - Dynamic range compression
- \* Contrast stretching vs. Histogram equalization
  - Histogram
  - Uniform histogram
  - HE derivation (572)
- \* Gray-level vs. Bit-plane slicing
  - MSB
- \* What's the philosophy behind Image averaging?
  - Derivation (572)

3

---

---

---

---

---

---

---

---

*Intuitively*

4

---

---

---

---

---

---

---

---

*From system point of view*

5

---

---

---

---

---

---

---

---

*Different approaches*

- \* Spatial domain
  - Point-based processing
  - Mask-based processing (neighbor-based processing) (spatial filters)
- \* Frequency domain
  - Frequency domain filters

6

---

---

---

---

---

---

---

---

## Point processing

- \* Simple gray level transformations
  - Image negatives
  - Log transformations
  - Power-law transformations
  - Contrast stretching
  - Gray-level slicing
  - Bit-plane slicing
- \* Histogram processing
  - Histogram equalization
  - Histogram matching (specification)
- \* Arithmetic/logic operations
  - Image averaging

---

---

---

---

---

---

---

---

## Some transformations

$$s = T(r) = L - 1 - r$$

$$s = T(r) = c \log(1 + |r|)$$

$$s = cr^r$$

$$s = T(r) = mr + b$$

$$s = T(r) = \begin{cases} 255 & \text{if } A \leq r \leq B \\ 0 & \text{otherwise} \end{cases}$$

---

---

---

---

---

---

---

---

## Image negatives

$$s = T(r) = L - 1 - r$$

FIGURE 3.4 (a) Original digital mammogram. (b) Negative image obtained using the negative transformation in Eq. (2-21). (Courtesy of G.E. Medical Systems.)

---

---

---

---

---

---

---

---

# Log transformation (Dynamic range compression)

$$s = T(r) = c \log(1 + |r|)$$

---

---

---

---

---

---

---

---

---

---

# Power-Law transformation

FIGURE 3.6 Plots of the equation  $s = cr^\gamma$  for various values of  $\gamma$  ( $c = 1$  in all cases).

$$s = cr^\gamma$$

FIGURE 3.9 (a) Actual image. (b)–(f) Results of gamma transformation in Eq. (3.23) with  $c = 1$  and  $\gamma = 0.4, 0.6, 1.0, 1.5,$  and  $5.0$ , respectively. (Original image for this example courtesy of NASA.)

---

---

---

---

---

---

---

---

---

---

# Gamma correction

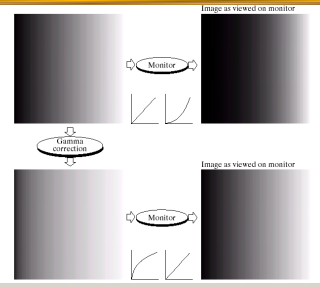

FIGURE 3.7 (a) Linear-wedge gray-scale image. (b) Response of monitor to linear wedge. (c) Gamma-corrected wedge. (d) Output of monitor.

---

---

---

---

---

---

---

---

---

---

### Contrast stretching

$$s = T(r) = mr + b$$

---

---

---

---

---

---

---

---

### Gray-level slicing

Highlighting an intensity range

$$s = T(r) = \begin{cases} 255 & \text{if } A \leq r \leq B \\ 0 & \text{otherwise} \end{cases}$$

---

---

---

---

---

---

---

---

### Bit-plane slicing

- \* Highlighting the contribution made by a specific **bit**.
- \* For pgm images, each pixel is represented by 8 bits.
- \* Each bit-plane is a **binary** image

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Point processing

---

- \* Simple gray level transformations
  - Image negatives
  - Log transformations
  - Power-law transformations
  - Contrast stretching
  - Gray-level slicing
  - Bit-plane slicing
- \* Histogram processing
  - Histogram equalization
  - Histogram matching (specification)
- \* Arithmetic/logic operations
  - Image averaging

17

---

---

---

---

---

---

---

---

## Histogram

---

- \* Gray-level histogram is a function showing, for each gray level, the number of pixels in the image that have that gray level.
 
$$n_k = hist[k] = \sum_{f(x,y)=k} 1$$
- \* Normalized histogram (probability):
 
$$p_k = n_k / N$$

18

---

---

---

---

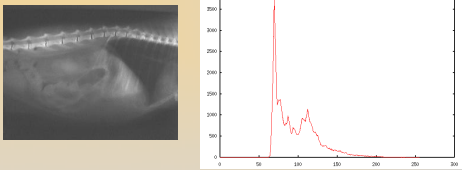

---

---

---

---

## Histogram - Examples

19

---

---

---

---

---

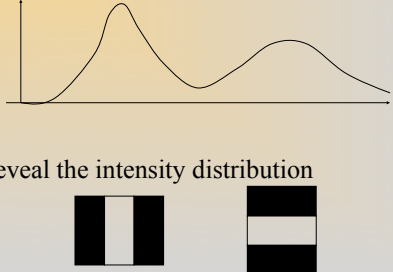

---

---

---

## Usage of histogram

- \* Find threshold
- \* Reveal the intensity distribution

20

---

---

---

---

---

---

---

---

## Mona Lisa and the results of contrast stretching

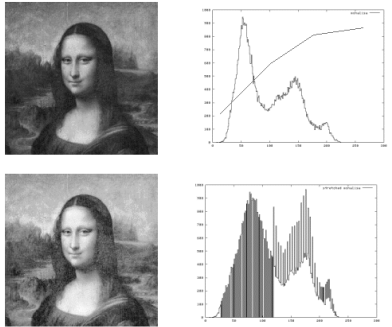

Figure 2. *Mona Lisa* and the results of contrast stretching

The histogram of *Mona Lisa* shows modes where gray level values accumulate we use linear stretching function in those areas (see upper right Figure), the resulting image and its histogram show a more balanced distribution of gray values.

21

---

---

---

---

---

---

---

---

### Question

- \* What does the histogram of a low-contrast image look like?
- \* How about high-contrast?

22

---

---

---

---

---

---

---

---

### Histogram equalization

- \* Why and when do we want to use HE?

23

---

---

---

---

---

---

---

---

### HE – Example 2

24

---

---

---

---

---

---

---

---

### HE – Derivation (572)

$s = T(r) \Rightarrow r = T^{-1}(s)$   
 $p_s(s) = \frac{p_r(r)}{\frac{ds}{dr}}$

$T(r)$  is single-valued and monotonically increasing within range of  $r$   
 $T(r)$  has the same range as  $r$  [0, 1]

$s_k = T(r_k) = \sum_{j=0}^k \frac{n_j}{n} = \sum_{j=0}^k p_r(r_j)$

$s = T(r) = \int_0^r p_r(w) dw$

$p_s(s) = \frac{p_r(r)}{\frac{ds}{dr}} = \frac{p_r(r)}{p_r(r)} = 1$

25

---

---

---

---

---

---

---

---

### Histogram equalization

- Transformation function
 
$$s = T(r) = \int_0^r p_r(w) dw \quad 0 \leq r \leq 1$$
- $p_r(w)$  is the **probability density function (pdf)**
- The transformation function is the **cumulative distribution function (CDF)**
- To make the **pdf** of the transformed image uniform, i.e. to make the histogram of the transformed image uniform

26

---

---

---

---

---

---

---

---

### HE – Discrete case

$s_k = T(r_k) = \sum_{j=0}^k \frac{n_j}{n} = \sum_{j=0}^k p_r(r_j)$

r	hist(r)
0	10
1	70
2	15
3	5

→

r	s
0	10
1	80
2	95
3	100

→

s	hist(s)
10	10
80	70
95	15
100	5

27

---

---

---

---

---

---

---

---

28

---

---

---

---

---

---

---

---

*HE - Discussion*

- \* Can contrast stretching achieve similar result as histogram equalization?
- \* If it can, why histogram equalization then?
- \* Why isn't the transformed histogram uniform?

29

---

---

---

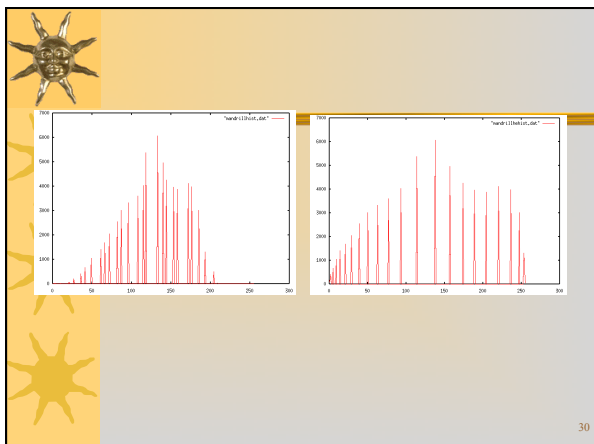

---

---

---

---

---

30

---

---

---

---

---

---

---

---

## Problems with HE

- \*???
- \*Solutions
  - ???

31

---

---

---

---

---

---

---

---

## \*Histogram specification

- \*Step1: Equalize the levels of the original image
- \*Step2: Specify the desired pdf and obtain the transformation function
- \*Step3: Apply the inverse transformation function to the levels obtained in step 1

32

---

---

---

---

---

---

---

---

## HS - Example

r	hist(r)
0	10
1	70
2	15
3	5

r	s
0	10
1	80
2	95
3	100

r	z
0	10
1	30
2	60
3	65

z	hist(z)
10	10
15	20
30	50
60	15

z	G(z)
10	10
15	30
30	80
60	95

Specified histogram

33

---

---

---

---

---

---

---

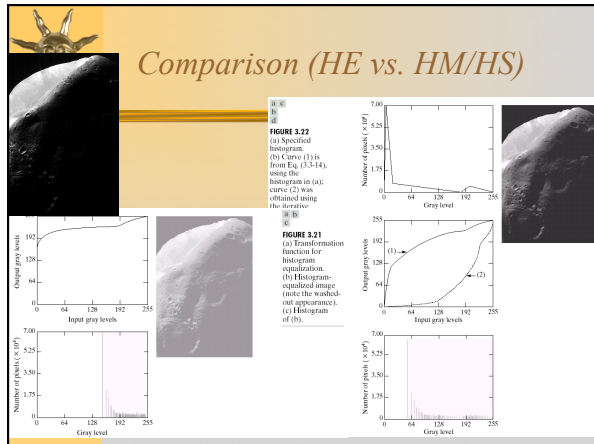

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

- ### Point processing
- \* Simple gray level transformations
    - Image negatives
    - Log transformations
    - Power-law transformations
    - Contrast stretching
    - Gray-level slicing
    - Bit-plane slicing
  - \* Histogram processing
    - Histogram equalization
    - Histogram matching (specification)
  - \* Arithmetic/logic operations
    - Image averaging

---

---

---

---

---

---

---

---

---

---

### Image averaging

original image  $f(x, y)$   $\rightarrow$   $\oplus$   $\rightarrow$  noisy image  $g(x, y)$   
 noise  $\eta(x, y)$

$$g(x, y) = f(x, y) + \eta(x, y)$$

$$\sum_{i=0}^{M-1} g_i(x, y) = \sum_{i=0}^{M-1} f(x, y) + \sum_{i=0}^{M-1} \eta(x, y)$$

$$\bar{g}(x, y) = \bar{f}(x, y) + \bar{\eta}(x, y)$$

37

---

---

---

---

---

---

---

---

### Image average (cont')

\* If the noise is uncorrelated and has zero expectation, then

$$E\{g(x, y)\} = f(x, y)$$

$$\sigma_{\bar{g}(x, y)}^2 = \frac{1}{M} \sigma_{\eta(x, y)}^2$$

38

---

---

---

---

---

---

---

---

### Image averaging – How to generate Gaussian noise? (572)

```

//This function creates a gaussian random number between -3 and 3
double gaussrand() {
  static double V1, V2, S;
  static int phase = 0;
  double X;

  if (phase == 0) {
    do {
      double U1 = (double)rand() / RAND_MAX;
      double U2 = (double)rand() / RAND_MAX;
      V1 = 2 * U1 - 1;
      V2 = 2 * U2 - 1;
      S = V1 * V1 + V2 * V2;
    } while(S >= 1 || S == 0);
    X = V1 * sqrt(-2 * log(S) / S);
  }
  else
    X = V2 * sqrt(-2 * log(S) / S);
  phase = 1 - phase;
  return X;
}
  
```

39

---

---

---

---

---

---

---

---

## Summary - Point processing

- \* Simple gray level transformations
  - Image negatives
  - Log transformations
  - Power-law transformations
  - Contrast stretching
  - Gray-level slicing
  - Bit-plane slicing
- \* Histogram processing
  - Histogram equalization
    - Derivation (572 only)
  - Histogram matching (specification) (572 only)
- \* Arithmetic/logic operations
  - Image averaging
    - Generation of Gaussian noise (572 only)
