

CS360 Midterm 1– Spring, 2016 – James S. Plank – February 16

In all of these questions, please assume the following:

- Pointers and longs are 4 bytes.
- The machine is little endian (like our lab machines and my Mac). So, if an the integer is 0xabcdef88, then its first byte is 0x88, and its last byte is 0xab.
- If you print the null character with %c, it will print nothing.
- There are no segmentation violations or bus errors in any of this code.

<pre>#include <stdio.h> #include <stdlib.h> #include <string.h> main() { char s[50]; char *x, *y; strcpy(s, "ABCDEFGHJKLMNOPQRSTUVWXYZ"); x = s + 2; y = x + 5; strcpy(x, "01234567"); strcat(y, "abcde"); printf("%s\n", s); printf("%s\n", x); printf("%s\n", y); printf("%s\n", x+15); }</pre>	<p><u>Question 1:</u> What is the output of this program?</p>	<pre>#include <stdio.h> #include <stdlib.h> #include <string.h> main() { char s[50]; char *argv[3]; int *ip; printf("0x%x 0x%x 0x%x 0x%x\n", '0', 'A', 'a', '\0'); argv[0] = "a.out"; argv[1] = "abc"; argv[2] = "AB"; strcpy(s, "01234567890123456789"); memcpy(s+12, argv[1], strlen(argv[1])); printf("%s\n", s); ip = (int *) s; memcpy(ip+1, argv[2], strlen(argv[2])+1); printf("%s\n", s); printf("0x%x\n", ip[2]); }</pre>	<p><u>Question 2:</u> The first line of this program's output is: 0x30 0x41 0x61 0x0 What is the rest of the output?</p>
<pre>#include <stdio.h> #include <stdlib.h> #include <string.h> typedef struct { int i; char c1; char c2; } XX; main() { char s[50]; XX *x; int j; strcpy(s, "ABCDEFGHJKLMNOPQRSTUVWXYZ"); x = (XX *) s; memcpy(x+1, x, sizeof(XX)); printf("%s\n", s); strcpy(s, "ABCDEFGH"); j = x->i; x->c1++; x->c2++; x->i++; printf("%s\n", s); x->i += (1 << 8); x->i += (1 << 17); printf("%s\n", s); printf("0x%x\n", x->i - j); }</pre>	<p><u>Question 3:</u> What is the output of this program?</p>	<pre>#include <stdio.h> #include <stdlib.h> #include <string.h> main() { int i, j; i = 0x12345; j = 0xf0f0f; printf("0x%x\n", i >> 8); printf("0x%x\n", j << 2); printf("0x%x\n", i & j); printf("0x%x\n", i j); printf("0x%x\n", i ^ j); printf("0x%x\n", j (j << 4)); printf("0x%x\n", (i << 12) j); }</pre>	<p><u>Question 4:</u> What is the output of this program?</p>
<p><u>Useful Prototypes:</u></p> <pre>void memcpy(void *to, void *from, int bytes); void strcpy(char *to, char *from); void strcat(char *to, char *from); int strlen(char *string);</pre>			

Question 5:	When the procedure a() is called, the 48 bytes of memory starting at address 0x100130 are as shown to the right, in hexadecimal. What is the output of a() when x=0x100130 ?	<table border="1"> <thead> <tr> <th><u>Address:</u></th> <th><u>Value:</u></th> </tr> </thead> <tbody> <tr><td>0x100130</td><td>0x10014c</td></tr> <tr><td>0x100134</td><td>0x100130</td></tr> <tr><td>0x100138</td><td>0x100130</td></tr> <tr><td>0x10013c</td><td>0x100150</td></tr> <tr><td>0x100140</td><td>0x100148</td></tr> <tr><td>0x100144</td><td>0x100138</td></tr> <tr><td>0x100148</td><td>0x10013c</td></tr> <tr><td>0x10014c</td><td>0x100138</td></tr> <tr><td>0x100150</td><td>0x100130</td></tr> <tr><td>0x100154</td><td>0x10014c</td></tr> <tr><td>0x100158</td><td>0x100144</td></tr> <tr><td>0x10015c</td><td>0x10014c</td></tr> </tbody> </table>	<u>Address:</u>	<u>Value:</u>	0x100130	0x10014c	0x100134	0x100130	0x100138	0x100130	0x10013c	0x100150	0x100140	0x100148	0x100144	0x100138	0x100148	0x10013c	0x10014c	0x100138	0x100150	0x100130	0x100154	0x10014c	0x100158	0x100144	0x10015c	0x10014c
