- Wave Apps

Grid Event Signature Library

Motivation

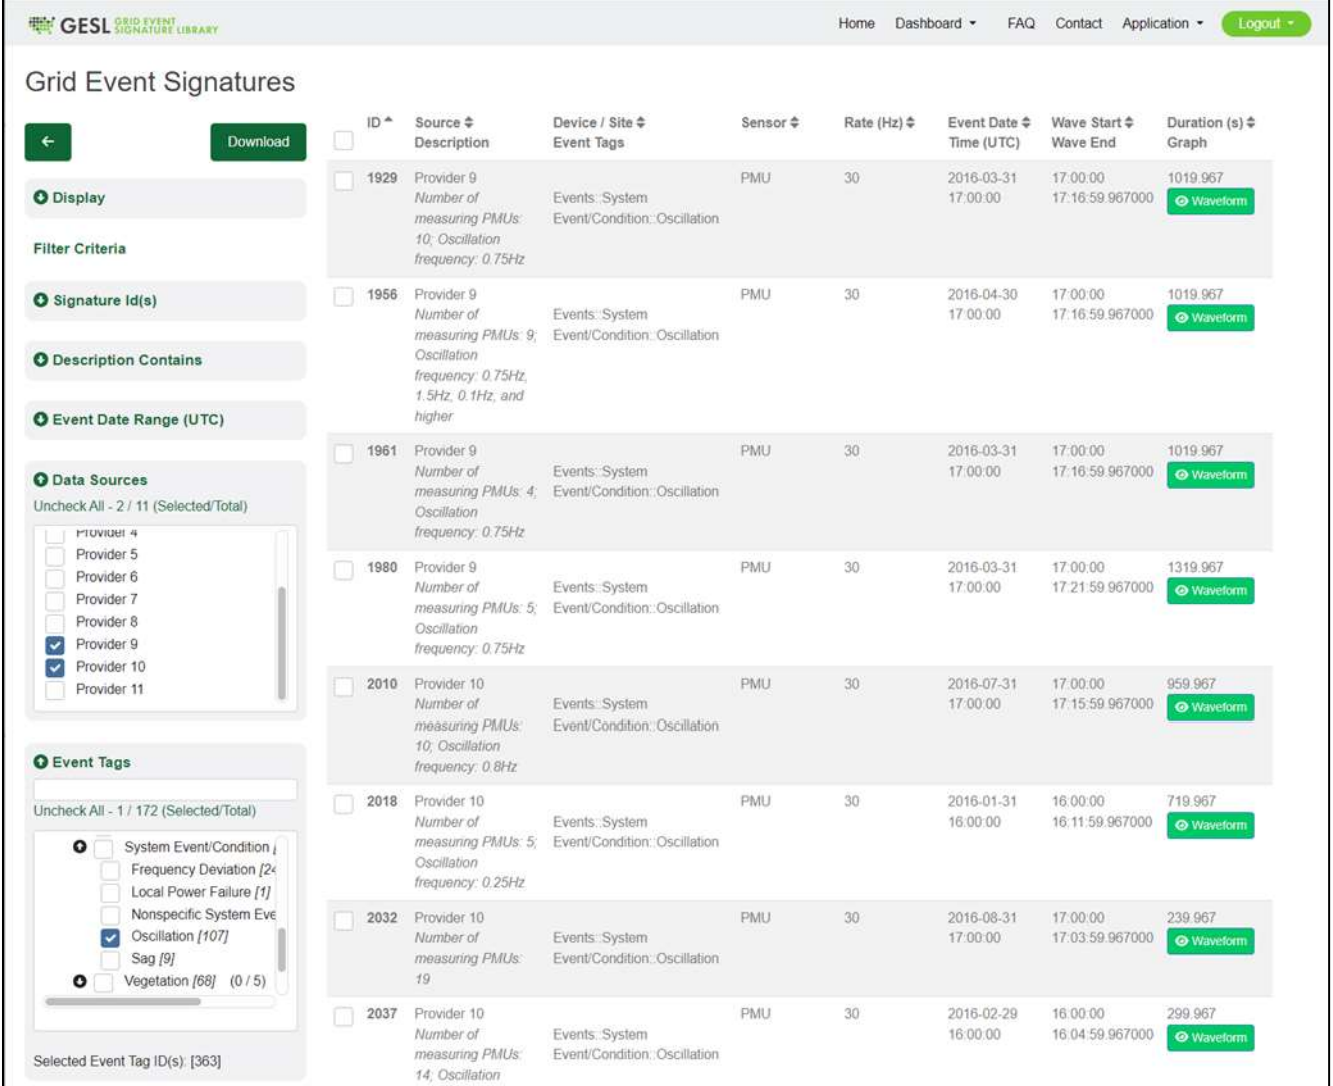

- DOE's Big Data Synchrophasor Analysis program highlighted the value of providing researchers with field-measured data
- DOE asked PNNL to make portions of the data publicly available in the Grid Event Signature Library (GESL) maintained by ORNL and LLNL [1]
- Common datasets improve the reproducibility of research and comparison of methods
- Simulated data cannot capture the diversity and complexity of real measurements

[1] A. J. Wilson et al., "The Grid Event Signature Library: An Open-Access Repository of Power System Measurement Signatures," in IEEE Access, vol. 12, pp. 76207-76218, 2024, doi: 10.1109/ACCESS.2024.3404886.

Accessing Oscillation Events

- Transmission PMU data stored in Provider 9 (Eastern Interconnection) and Provider 10 (Western Interconnection) [2]
- Total: 1694 events
- Oscillations: 107
- Oscillations tagged as Events::System Event/Condition::Oscillation

The screenshot displays the GESL Grid Event Signature Library interface. The main table lists event signatures with columns for ID, Source, Device / Site, Sensor, Rate (Hz), Event Date, Wave Start, and Duration. The table shows several entries for Provider 9 and Provider 10, all tagged as Oscillation events. The left sidebar contains filter criteria for Signature Id(s), Description Contains, Event Date Range (UTC), Data Sources (Provider 4-11), and Event Tags (System Event/Condition, Frequency Deviation, Local Power Failure, Nonspecific System Eve, Oscillation, Sag, Vegetation).

ID	Source	Device / Site	Sensor	Rate (Hz)	Event Date	Wave Start	Duration (s)
1929	Provider 9	Events: System	PMU	30	2016-03-31	17:00:00	1019.967
1956	Provider 9	Events: System	PMU	30	2016-04-30	17:00:00	1019.967
1961	Provider 9	Events: System	PMU	30	2016-03-31	17:00:00	1019.967
1980	Provider 9	Events: System	PMU	30	2016-03-31	17:00:00	1319.967
2010	Provider 10	Events: System	PMU	30	2016-07-31	17:00:00	959.967
2018	Provider 10	Events: System	PMU	30	2016-01-31	16:00:00	719.967
2032	Provider 10	Events: System	PMU	30	2016-08-31	17:00:00	239.967
2037	Provider 10	Events: System	PMU	30	2016-02-29	16:00:00	299.967

Use Case 1

Impact of Frequency Error on Two OSL Algorithms

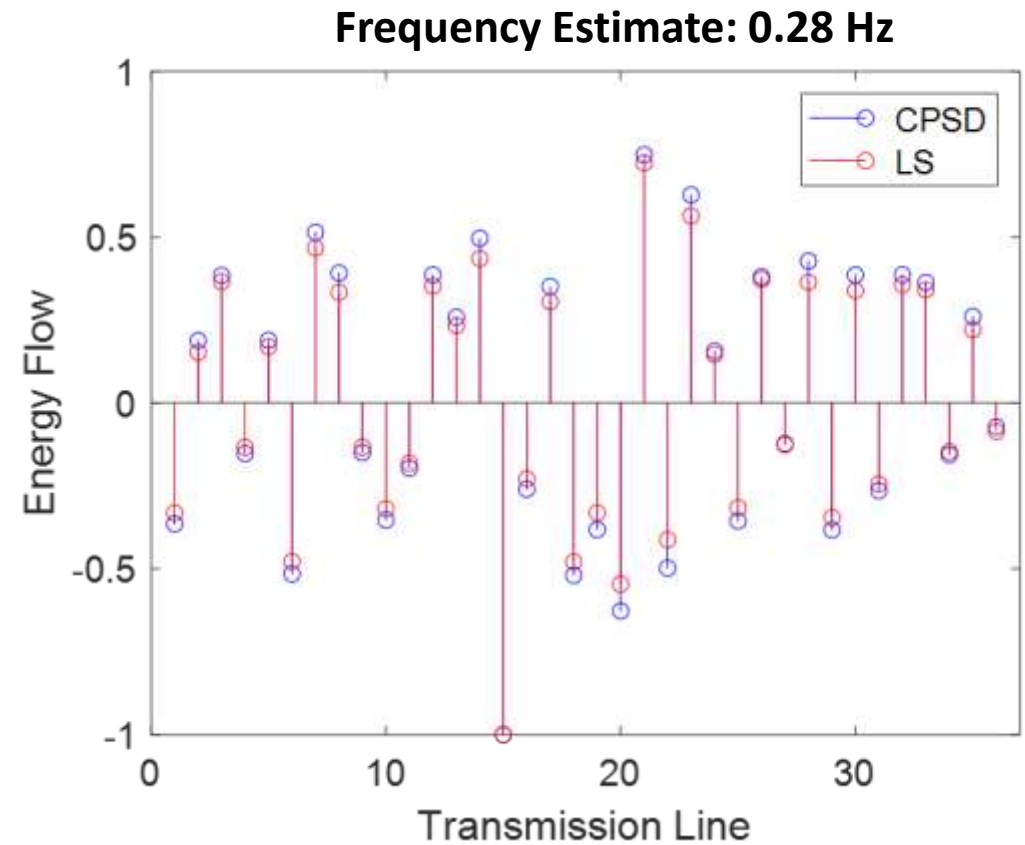

- GESL entry 1003 contains a 0.274 Hz oscillation
- The dissipating energy flow can be calculated multiple ways [1]:
 - Cross-power spectral density (CPSD)
 - Least squares (LS)
- Which is more robust to errors in the oscillation's frequency?

[1] <http://hdl.handle.net/10125/64111>

Use Case 1

Impact of Frequency Error on Two OSL Algorithms

Use Case 2

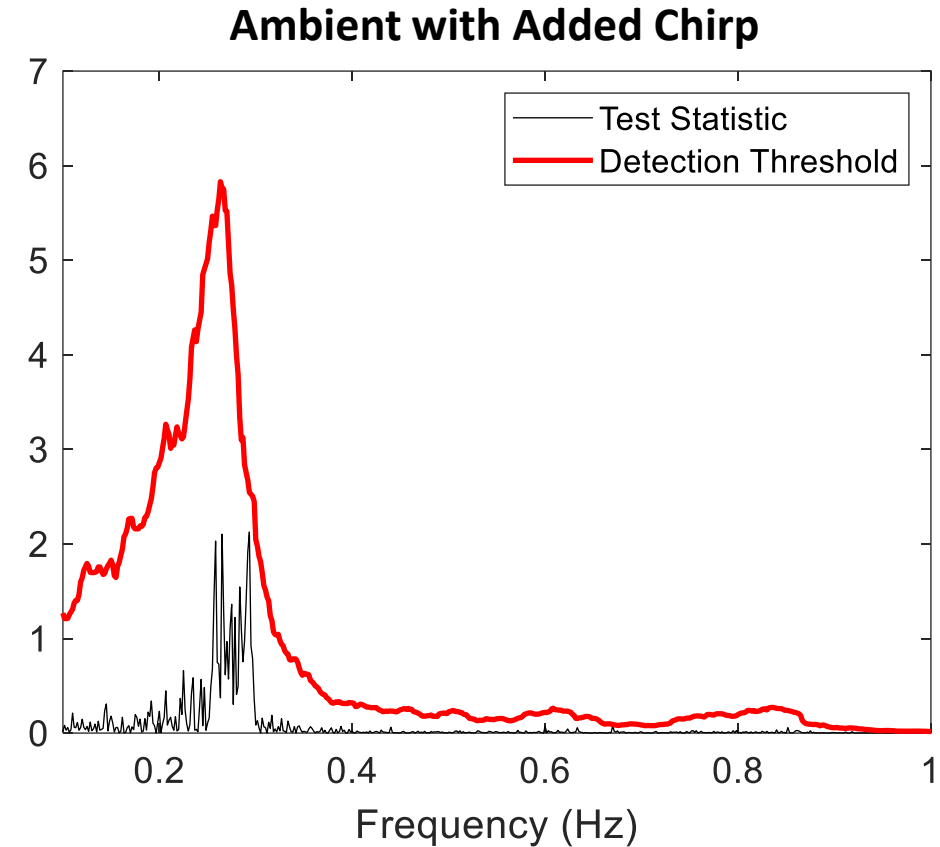

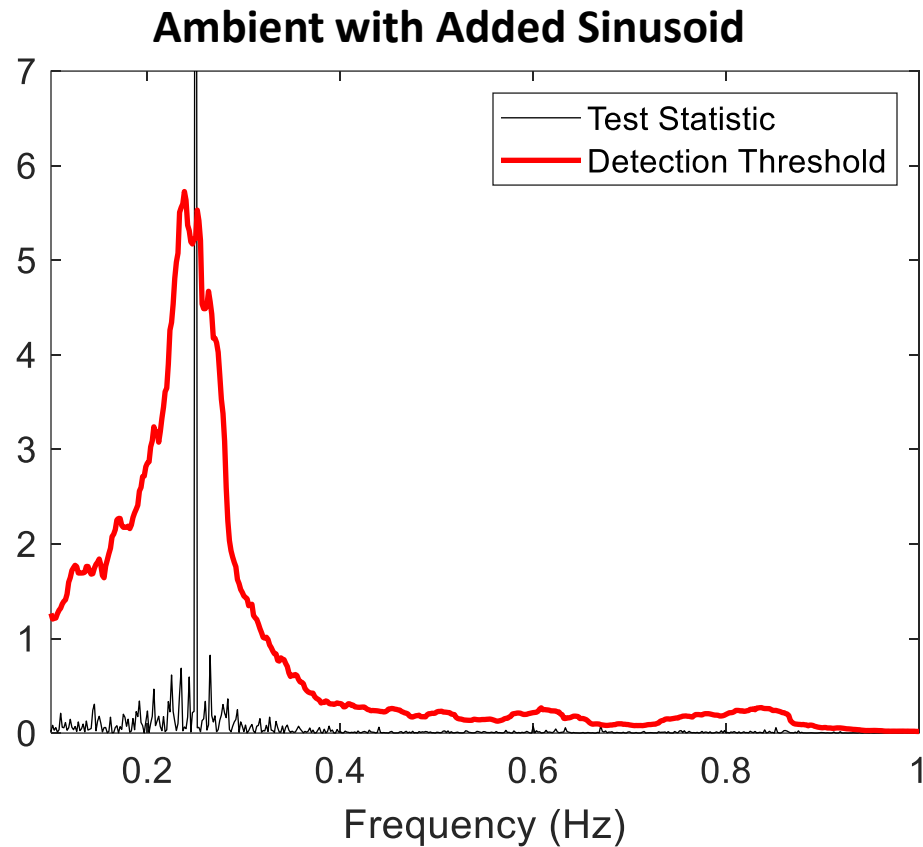

Impact of Varying Frequency on Detection

- The GESL also contains ambient data
 - State::Steady State::Nonspecific Steady State
- For oscillation studies, realistic noise can be helpful in comparing algorithms
- Signals can be added to explore performance

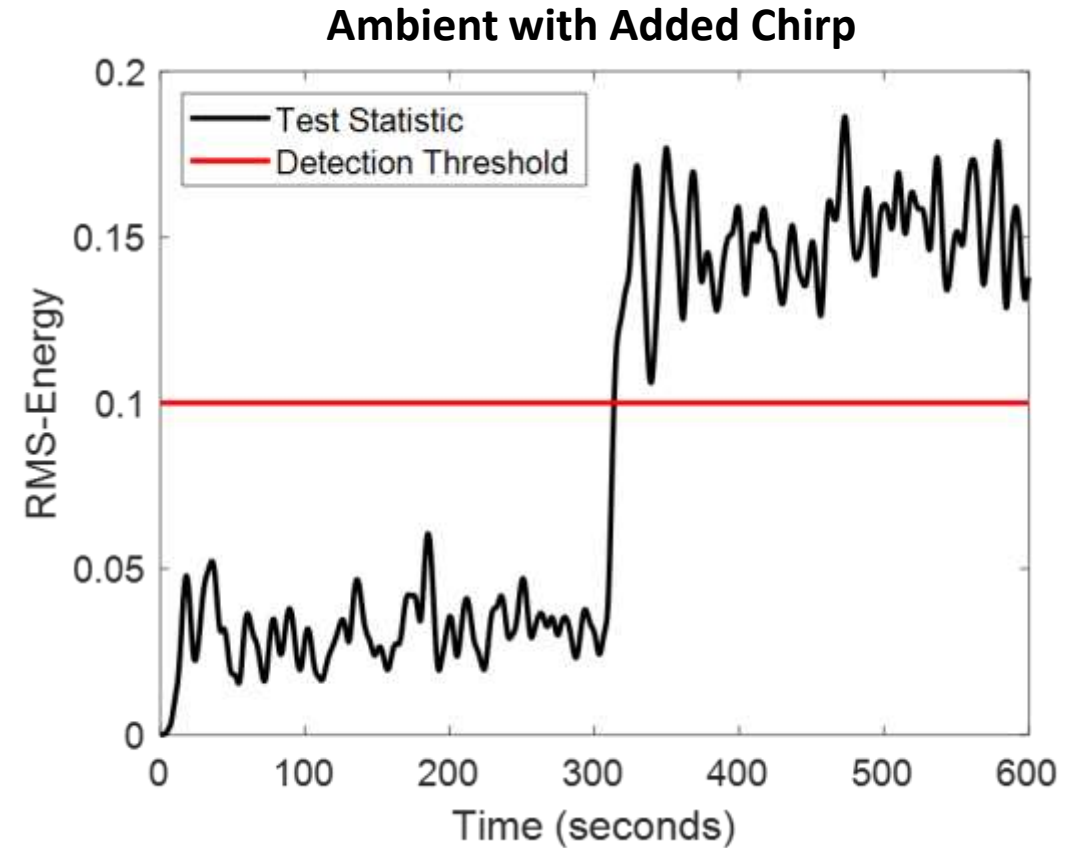

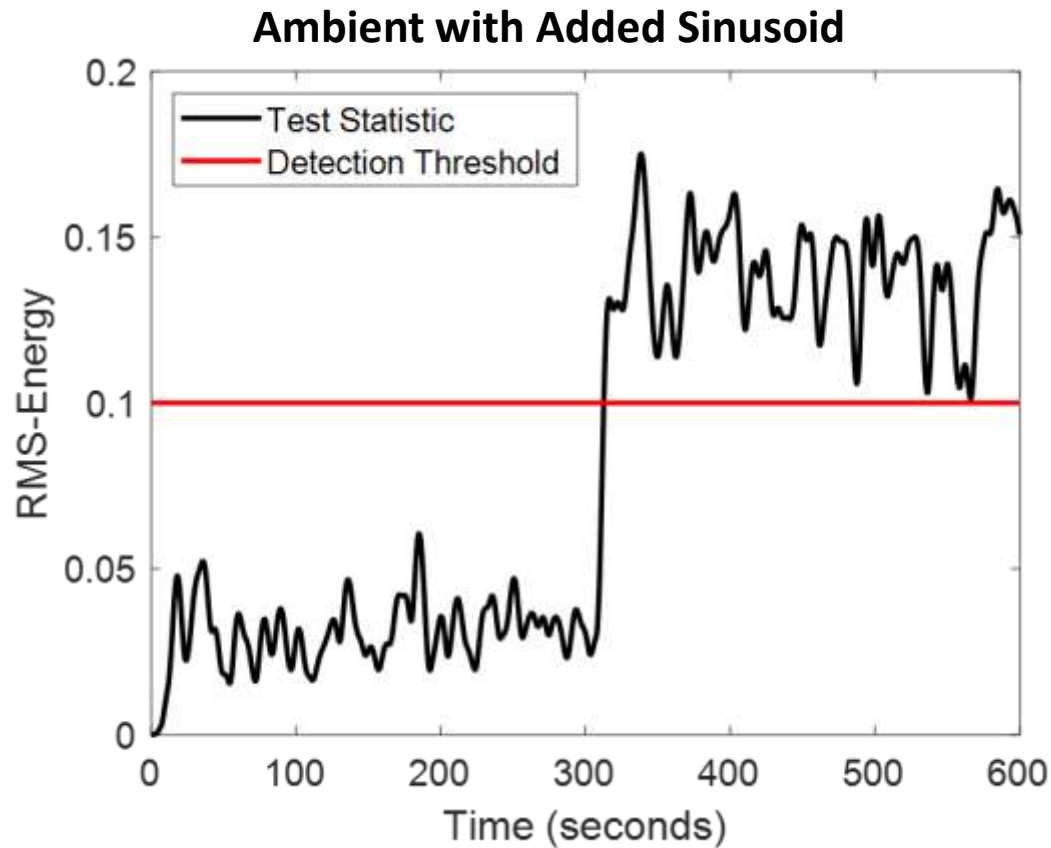

Use Case 2

Impact of Varying Frequency on Detection – Algorithm 1

Use Case 2

Impact of Varying Frequency on Detection – Algorithm 2

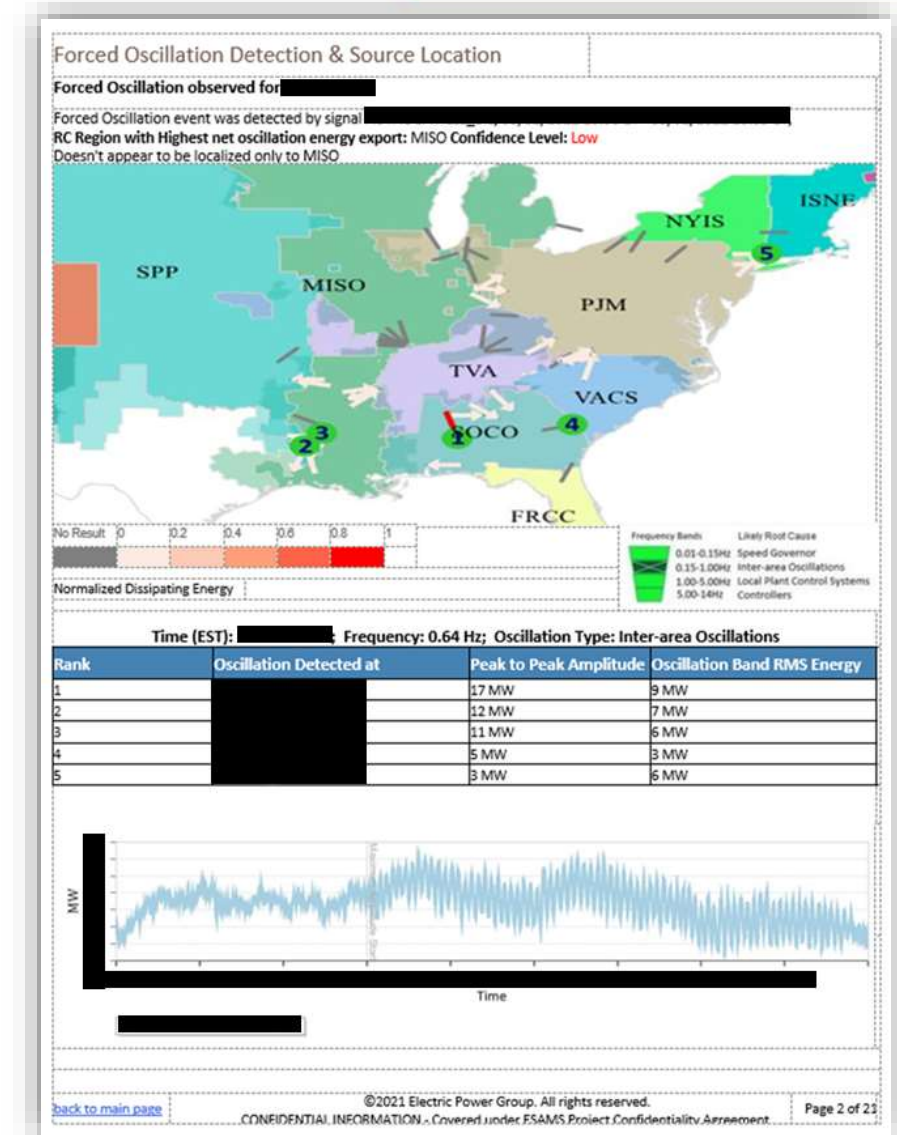

Eastern Interconnection Situational Awareness and Monitoring System (ESAMS)

ESAMS Concept

- Software tool developed by Electric Power Group (EPG) and PNNL with leadership from LBNL
- Purpose
 - Introduce a common, high-level interconnection-wide view based on synchrophasor information
 - Improve coordination among reliability coordinators

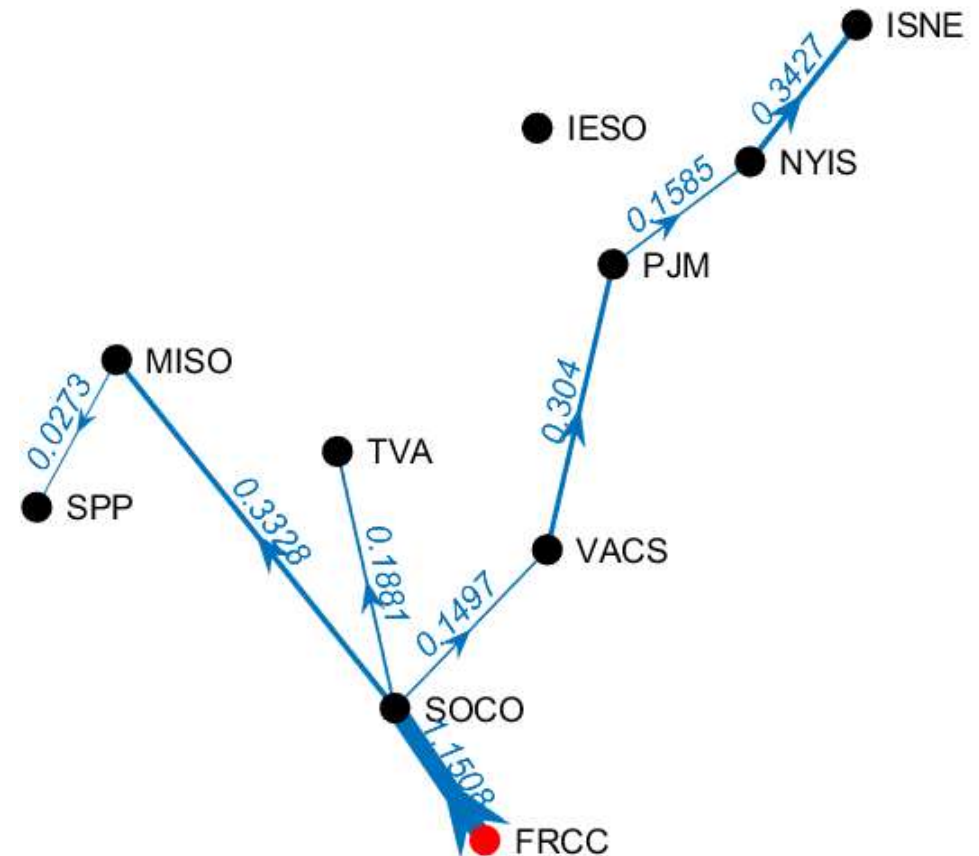

Initial Demonstration

- Live demonstration ran from June 2021 through March 2022
- Hosted by PJM
- Seven Reliability Coordinators participated
- Daily reports summarized previous day's events
 - 65 oscillation events reported
- Real-time notifications for oscillations larger than 10 MW

Regional Source Localization

- Identifying exact source impractical at interconnection scale
- PMUs used to calculate Dissipating Energy Flow (DEF) on tie-lines
- The region with the highest net export is identified as the source

Southern Company Deployment

- Currently monitoring Southern Company's northern and southern borders
- Nine significant (typically > 10 MW) events detected since May
- Study topics
 - Comparing ESAMS with the RMS-energy detector in EPG's RTDMS
 - Using ESAMS to monitor regions within a reliability coordinator
 - Updating ESAMS notifications to make them more useful to system operators

Planned Cloud Deployment

- A cloud deployment has potential advantages
 - Does not require a single entity to accept hosting responsibilities
 - Avoid bi-lateral data exchange
 - Flexible for future expansion
- Plan:
 - ESAMS will be deployed in an Amazon Web Services cloud environment
 - PMU data streamed from ISO-NE and PJM
 - Considered regions: ISO-NE, NYISO, PJM
 - 6-month demonstration scheduled to begin fall 2024
 - If successful, additional participants will be invited to join

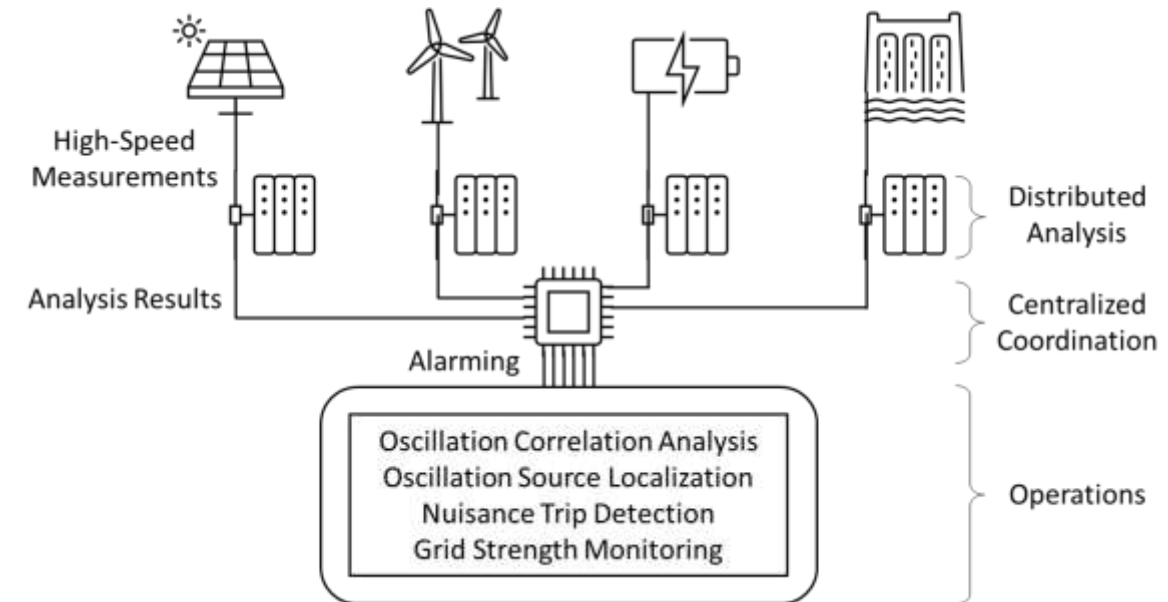

Wave Apps

Wave Apps

Upcoming project funded under SETO's OPTIMA

- Scheduled to begin October 1
- Motivation
 - IBR integration would benefit from wide-area high-speed waveform measurements
 - Continuous streaming is impractical for many utilities
- Key outcome: distributed platform to host an extensible set of applications

Team

PNNL – Management, Application development
 Grid Protection Alliance – Software development
 University of Texas at San Antonio – Application development, Testbed
 GE Vernova – Application development
 Salt River Project – Field demonstration
 Southern California Edison – Testbed evaluation

Thank You!
