C. Slime Mold

*(Dictyostelium discoideum)*

“Dicty”

---

**Amoeba Stage**

- Single cell
- Lives in soil
- Free moving
- Engulfs food (bacteria)
- Divides asexually

---

**Complete Life Cycle**

---

**Self-copying Robot (2005)**

- Hod Lipson, Cornell
- Programmable blocks
- 2 swiveling pyramidal halves
- Magnetic connections
- 10 cm across
- One stack can assemble another

---

**Amoebas**

---

*Published by AAAS*

Aggregation Stage
- Triggered by exhaustion of food
- Aggregate by chemotaxis
- Example: 180 cells
- Time lapse: about 14 hours

Spiral Waves
- Spiral accelerate cell aggregation (18 vs. 3 μm/min.)
- Waves propagate 120 – 60 μm/min.
- 1 frame = 36 sec.

Center of Spiral
- Mechanisms of spiral formation are still unclear
- Involves symmetry breaking
- 1 frame = 10 sec.

Stream Formation Stage
- Streams result from dependence of wave propagation velocity on cell density
- Breaks symmetry
- As density increases, begin to adhere
- Begin to form mound

Mound Stage
- Cells differentiate
- Some form an elongated finger
Part 2C: Slime Mold

**Concentric Waves in Mounds**
- Concentric or spiral waves
- Mound comprises $10^3$ to $10^5$ cells
- Cells begin to differentiate
- 1 frame = 20 sec.

**Multiple Centers**
- Multiple pacemakers
- Wave fronts mutually extinguish (typical of excitable media)
- One center eventually dominates

**Multi-armed Spirals**
- This mound has 5 spiral arms
- Up to 10 have been observed

**Formation of Acellular Sheath**
- Composed of cellulose & a large glycoprotein
- Covers mound and is left behind slug as trail
- Function not entirely understood:
  - protection from nematodes (worms)
  - control of diffusion of signaling molecules

**Slug Stage**
- Prestalk elongates, topples, to form slug
- Behaves as single organism with $10^5$ cells
- Migrates; seeks light; seeks or avoids heat
- No brain or nervous system

**Movement of Young Slug**
- Time-lapse (1 frame = 10 sec.)
- Note periodic up-and-down movement of tip
**Movement of Older Slug**

- Note rotating prestalk cells in tip
- Pile of anterior-like cells on prestalk/prespore boundary
- Scale bar = 50 µm, 1 frame = 5 sec.

**Migration of Older Slug**

- Scale bar = 100 µm, 1 frame = 20 sec.

**Culmination Stage**

- Cells differentiate into base, stalk, and spores
- Prestalk cells form rigid bundles of cellulose & die
- Prespore cells (at end) cover selves with cellulose & become dormant

**Stages of Culmination**

**Cell Differentiation at Culmination**

**Early Culmination**

- During early culmination all cells in prestalk rotate
- Scale bar = 50 µm, 1 frame = 25 sec.
Late Culmination

- Vigorous rotation at prestalk/prespore boundary
- Scale bar = 100 µm, 1 frame = 10 sec.

Fruiting Body Stage

- Spores are dispersed
- Wind or animals carry spores to new territory
- If sufficient moisture, spores germinate, release amoebas
- Cycle begins again

Cooperation and Altruism in Dicty

- Cooperation is essential to Dicty signaling and aggregation
- “Altruism” is essential in stalk formation
- How is cooperation encouraged and cheating discouraged?
- In one case the same gene prevents cheating and allows cohesion
- Green-beard genes?

Microbial Cooperation and Altruism

- Different slime mold: Physarum polycephalum
- Lengths: $\alpha_1$ (41mm), $\alpha_2$ (33), $\beta_1$ (44), $\beta_2$ (45)
- AG = food sources
- (a) initial, (b) exploring possible connections (4 hrs), (c) shortest (4 more)
Part 2C: Slime Mold

Slime Mold-Controlled Robot
- Robot sensors relayed to remote computer
- Light is shined on slime mold
- Slime mold retracts
- Motion tracked and used to control robot
- *Physarum polycephalum*

Slime Mold Computation of Roman Road Network

Emergent Patterns During Aggregation
- a-c. As aggregate, wavelengths shorten
- d. Population divides into disjoint domains
- e-f. Domains contract into “fingers” (streaming stage)

Belousov-Zhabotinski Reaction

Hodgepodge Machine

Demonstration of Hodgepodge Machine

Run NetLogo B-Z Reaction Simulator
- Run Hodgepodge simulator at CBN
  - Online Experimentation Center

Universal Properties

• What leads to these expanding rings and spirals in very different systems?
• Under what conditions do these structures form?
• What causes the rotation?
• These are all examples of excitable media
