C. Slime Mold

*(Dictyostelium discoideum)*

“Dicty”

---

**Self-organization in Bio-inspired Robotics**

---

**Self-copying Robot (2005)**

- Hod Lipson, Cornell
- Programmable blocks
- 2 swiveling pyramidal halves
- Magnetic connections
- 10 cm across
- One stack can assemble another

---

**Dicty Videos**

- Bonner’s videos
- Aggregation
- Life cycle

---

**Amoeba Stage**

- Single cell
- Lives in soil
- Free moving
- Engulfs food (bacteria)
- Divides asexually
Part 2C: Slime Mold

Amoebas

Aggregation Stage
- Triggered by exhaustion of food
- Aggregate by chemotaxis
- Example: 180 cells
- Time lapse: about 14 hours

Science 21 May 2010: Vol. 328, 1021–1025

Aggregation Stage
- Triggered by exhaustion of food
- Aggregate by chemotaxis
- Example: 180 cells
- Time lapse: about 14 hours

Spiral Waves
- Spiral accelerate cell aggregation (18 vs. 3 mm/min.)
- Waves propagate 120–60 mm/min.
- 1 frame = 36 sec.

Center of Spiral
- Mechanisms of spiral formation are still unclear
- Involves symmetry breaking
- 1 frame = 10 sec.

Stream Formation Stage
- Streams result from dependence of wave propagation velocity on cell density
- Breaks symmetry
- As density increases, begin to adhere
- Begin to form mound

(Video < Zool. Inst., Univ. München)
Part 2C: Slime Mold

Mound Stage
- Cells differentiate
- Some form an elongated finger

Concentric Waves in Mounds
- Concentric or spiral waves
- Mound comprises $10^3$ to $10^5$ cells
- Cells begin to differentiate
- 1 frame = 20 sec.

Multiple Centers
- Multiple pacemakers
- Wave fronts mutually extinguish (typical of excitable media)
- One center eventually dominates

Multi-armed Spirals
- This mound has 5 spiral arms
- Up to 10 have been observed

Formation of Acellular Sheath
- Composed of cellulose & a large glycoprotein
- Covers mound and is left behind slug as trail
- Function not entirely understood:
  - protection from nematodes (worms)
  - control of diffusion of signaling molecules

Slug Stage
- Prestalk elongates, topples, to form slug
- Behaves as single organism with $10^5$ cells
- Migrates; seeks light; seeks or avoids heat
- No brain or nervous system
Part 2C: Slime Mold

Movement of Young Slug

- Time-lapse (1 frame = 10 sec.)
- Note periodic up-and-down movement of tip

Movement of Older Slug

- Note rotating prestalk cells in tip
- Pile of anterior-like cells on prestalk/prespore boundary
- Scale bar = 50 mm, 1 frame = 5 sec.

Migration of Older Slug

- Scale bar = 100 mm, 1 frame = 20 sec.

Culmination Stage

- Cells differentiate into base, stalk, and spores
- Prestalk cells form rigid bundles of cellulose & die
- Prespore cells (at end) cover selves with cellulose & become dormant

Stages of Culmination

Cell Differentiation at Culmination

- Figure from Kessin, *Dictyostelium*
Part 2C: Slime Mold

Early Culmination

- During early culmination all cell in prestalk rotate
- Scale bar = 50 mm, 1 frame = 25 sec.

Late Culmination

- Vigorous rotation at prestalk/prespore boundary
- Scale bar = 100 mm, 1 frame = 10 sec.

Fruiting Body Stage

- Spores are dispersed
- Wind or animals carry spores to new territory
- If sufficient moisture, spores germinate, release amoebas
- Cycle begins again

Cooperation and Altruism in Dicty

- Cooperation is essential to Dicty signaling and aggregation
- “Altruism” is essential in stalk formation
- How is cooperation encouraged and cheating discouraged?
- In one case the same gene prevents cheating and allows cohesion
- Green-beard genes?

Microbial Cooperation and Altruism

**Slime Mold Solving Maze**
- Different slime mold: *Physarum polycephalum*
- Lengths: $\alpha_1$ (41mm), $\alpha_2$ (33), $\beta_1$ (44), $\beta_2$ (45)
- AG = food sources
- (a) initial, (b) exploring possible connections (4 hrs), (c) shortest (4 more)

**Slime Mold-Controlled Robot**
- Robot sensors relaied to remote computer
- Light image shines on slime mold
- Slime mold retracts
- Motion tracked and used to control robot
- *Physarum polycephalum*

**Slime Mold Computation of Roman Road Network**

**Emergent Patterns During Aggregation**
- a-c. As aggregate, wave lengths shorten
- d. Population divides into disjoint domains
- e-f. Domains contract into “fingers” (streaming stage)

**Belousov-Zhabotinski Reaction**

**Hodgepodge Machine**
Demonstration of Hodgepodge Machine

Run NetLogo B-Z Reaction Simulator

Run Hodgepodge simulator at CBN Online Experimentation Center

Universal Properties

• What leads to these expanding rings and spirals in very different systems?
• Under what conditions do these structures form?
• What causes the rotation?
• These are all examples of excitable media
