

ECE 472/572 - Digital Image Processing

Lecture 5 - Image Enhancement - Frequency Domain Filters

09/13/11

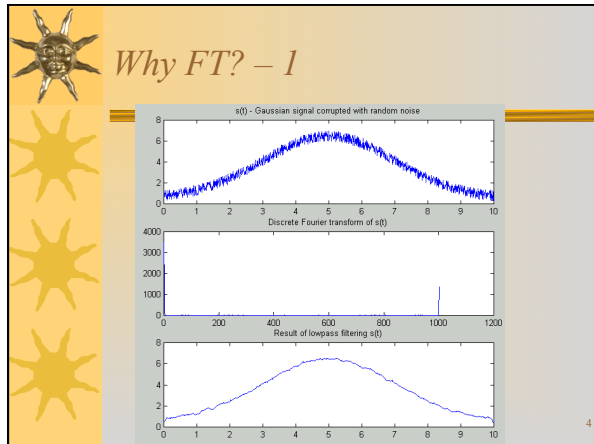

Roadmap

- * Introduction
 - Image format (vector vs. bitmap)
 - IP vs. CV vs. CG
 - HLLP vs. LLIP
 - Image acquisition
- * Perception
 - Structure of human eye
 - rods vs. cones (Scotopic vision vs. photopic vision)
 - Fovea and blind spot
 - Flexible lens (near-sighted vs. far-sighted)
 - Brightness adaptation and Discrimination
 - Weber ratio
 - Dynamic range
 - Image resolution
 - Sampling vs. quantization
- * Image enhancement
 - Enhancement vs. restoration
 - Spatial domain methods
 - Point-based methods
 - Log trans. vs. Power-law
 - Gamma correction
 - Dynamic range compression
 - Contrast stretching vs. HE
 - What is HE?
 - Derivation of trans. func.
 - Gray-level vs. Bit plane slicing
 - Image averaging (principle)
 - Mask-based (neighborhood-based) methods - spatial filter
 - Smoothing vs. Sharpening filter
 - Linear vs. Non-linear filter
 - Smoothing
 - Average vs. weighted average
 - Average vs. Median
 - Sharpening
 - LM vs. High boosting
 - 1st vs. 2nd derivatives
 - Frequency domain methods

Questions

- * In-depth understanding
 - Why do we need to conduct image processing in the frequency domain?
 - What does Fourier series do?
 - What does the Fourier spectrum of an image tell you?
 - How to calculate the fundamental frequency?
 - Why is padding necessary?
- * Properties
 - Is FT a linear or nonlinear process?
 - What would the FT of a rotated image look like?
 - When implementing FFT, what kind of properties are used?
 - What does the autocorrelation of an image tell you?
 - What is $F(0,0)$? Or Why is the center of the FT extremely bright?

Why FT? – 2

$$g(x, y) = h(x, y) * f(x, y) \Leftrightarrow G(u, v) = H(u, v)F(u, v)$$

$$g(x, y) = F^{-1}\{H(u, v)F(u, v)\}$$

Fourier series

- * Fourier series (S_F) can represent any function over a finite interval T_F
- * Outside T_F , S_F repeats **periodically** with period T_F .

$$\text{complex form: } s(t) = \sum_{n=-\infty}^{\infty} c_n e^{j2n\pi f_F t}$$

$$c_n = \frac{1}{T_F} \int_{-T_F/2}^{T_F/2} s(t) e^{-j2n\pi f_F t} dt$$

7

Fourier series (cont')

- * T_F is the interval of signal $s(t)$ over which the Fourier series represents
- * $f_F = 1/T_F$ is the fundamental frequency of the Fourier series representation
- * n is called the "harmonic number"
 - E.g., $2f_F$ is the second harmonic of the fundamental frequency f_F .
- * The Fourier series representation is always periodic and is linear combinations of sinusoids at f_F and its harmonics.

8

Fourier transform

- * Describe the frequency distribution

c_n

$n f_F$

9

 **1-D Fourier transform**

- * Fourier transform: $F(u) = \int_{-\infty}^{\infty} f(t) \exp(-j2\pi ut) dt$
- * Inverse FT: $f(t) = \int_{-\infty}^{\infty} F(u) \exp(j2\pi ut) du$
- * Complex form: $F(u) = R(u) + jI(u)$
 $F(u) = |F(u)| e^{j\phi(u)}$
- * Fourier spectrum: $|F(u)| = \sqrt{R^2(u) + I^2(u)}$
- * Power spectrum (spectral density): $P(u) = |F(u)|^2$
- * Phase angle: $\phi(u) = \tan^{-1} \left[\frac{I(u)}{R(u)} \right]$

DFT

$$F(u) = \frac{1}{N} \sum_{x=0}^{N-1} f(x) \exp(-j2\pi ux / N)$$

$$f(x) = \sum_{u=0}^{N-1} F(u) \exp(j2\pi ux / N)$$

11

 **2-D Fourier transform**

- * CFT: $F(u, v) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) \exp[-j2\pi(ux + vy)] dx dy$
 $f(x, y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} F(u, v) \exp[j2\pi(ux + vy)] du dv$
- * DFT: $F(u, v) = \frac{1}{MN} \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) \exp[-j2\pi(ux / M + vy / N)]$
 $f(x, y) = \sum_{u=0}^{M-1} \sum_{v=0}^{N-1} F(u, v) \exp[j2\pi(ux / M + vy / N)]$

12

Understanding and implementing Fourier transform

$$F(u, v) = \frac{1}{MN} \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) \exp[-j2\pi(ux/M + vy/N)]$$

$$f(x, y) = \sum_{u=0}^{M-1} \sum_{v=0}^{N-1} F(u, v) \exp[j2\pi(ux/M + vy/N)]$$

13

$$F(0,0) = \frac{1}{2*2} (f(0,0) + f(0,1) + f(1,0) + f(1,1)) = 127.5$$

$$F(0,1) = \frac{1}{2*2} (f(0,0) * e^{-j2\pi(0*0/2+1*0/2)} + f(0,1) * e^{-j2\pi(0*0/2+1*1/2)} + f(1,0) * e^{-j2\pi(1*0/2+1*0/2)} + f(1,1) * e^{-j2\pi(1*0/2+1*1/2)}) = -127.5$$

$$F(1,0) = \frac{1}{2*2} (f(0,0) * e^{-j2\pi(1*0/2+0*0/2)} + f(0,1) * e^{-j2\pi(1*0/2+0*1/2)} + f(1,0) * e^{-j2\pi(1*1/2+0*0/2)} + f(1,1) * e^{-j2\pi(1*1/2+0*1/2)}) = 0$$

$$F(1,1) = \frac{1}{2*2} (f(0,0) * e^{-j2\pi(1*0/2+1*0/2)} + f(0,1) * e^{-j2\pi(1*0/2+1*1/2)} + f(1,0) * e^{-j2\pi(1*1/2+1*0/2)} + f(1,1) * e^{-j2\pi(1*1/2+1*1/2)}) = 0$$

14

Understanding and implementing Fourier transform

* According to "translation"

For one complete period,

$$f(x, y)(-1)^{x+y} \Leftrightarrow F(u - M/2, v - N/2)$$

15

Understanding and implementing Fourier transform

16

Block diagram of FT \leftrightarrow IFT

Frequency domain filtering operation

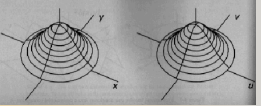

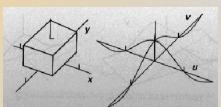

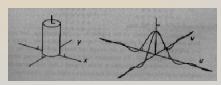

FIGURE 4.5 Basic steps for filtering in the frequency domain.

17

Impulse transforms

18

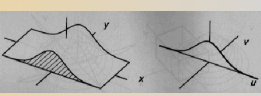

Typical transforms

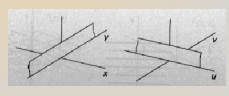

- * Gaussian hump \leftrightarrow Gaussian hump
 
- * Rectangular (square aperture) \leftrightarrow sinc
 
- * Pillbox (circular aperture) \leftrightarrow jinc
 

19

Typical transforms

- * Gaussian ridge

$$\exp(-\pi x^2)$$

- * Line impulse

$$\tau^{-1} \exp(-\pi x^2 / \tau^2)$$
 when $\tau \rightarrow 0$

20

Reference

- * All figures scanned from R. N. Bracewell's "Two-Dimensional Imaging," Prentice Hall, 1995.

21

2D FT pairs

$f(x, y)$	$F(u, v)$
$\delta(x, y)$	1
$\delta(x \pm x_0, y \pm y_0)$	$\exp(\pm j2\pi x_0 u) \exp(\pm j2\pi y_0 v)$
$rect(x, y)$	$\text{sinc}(u, v)$
$tri(x, y)$	$\text{sinc}^2(u, v)$
$comb(x, y)$	$comb(u, v)$
$\exp[-\pi(x^2 + y^2)]$	$\exp[-\pi(u^2 + v^2)]$

22

Important properties of FT

- * Linearity (distributivity & scaling)
- * Separability
- * Translation
- * Periodicity
- * Conjugate symmetry
- * Rotation
- * Convolution
- * Correlation
- * Sampling

23

Linearity

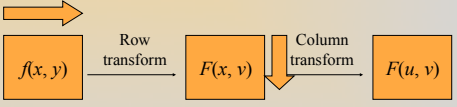

* FT is a linear image processing method

24

Separability

$$F(u, v) = \frac{1}{MN} \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) \exp[-j2\pi(ux/M + vy/N)]$$

25

Translation

$$f(x, y) \exp[j2\pi(u_0x + v_0y)/N] \Leftrightarrow F(u - u_0, v - v_0)$$

$$f(x - x_0, y - y_0) \Leftrightarrow F(u, v) \exp[-j2\pi(ux_0 + vy_0)/N]$$

To show one complete period,

$$f(x, y)(-1)^{x+y} \Leftrightarrow F(u - N/2, v - N/2)$$

26

Periodicity and Conjugate symmetry

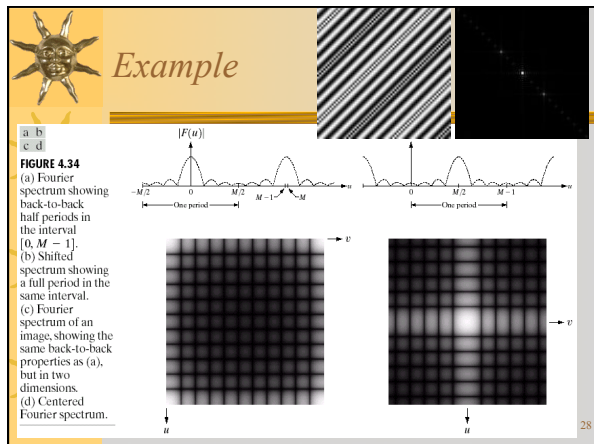

- * Periodicity

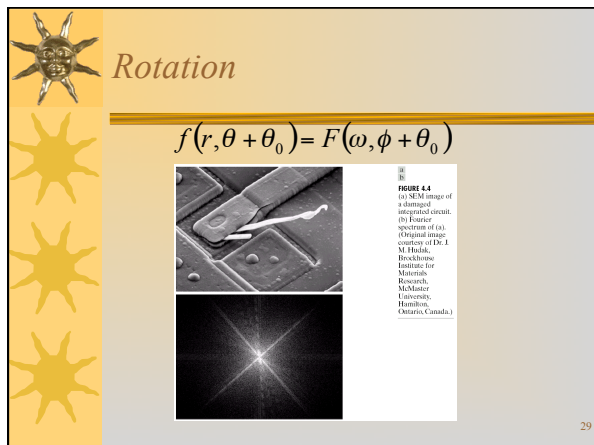

$$F(u, v) = F(u + N, v) = F(u, v + N) = F(u + N, v + N)$$
- * Conjugate symmetry

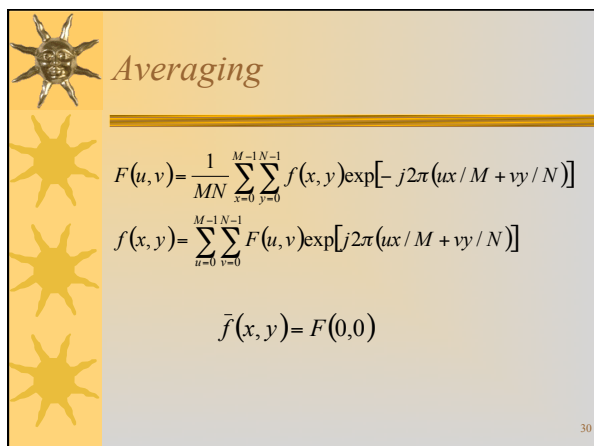

$$F(u, v) = F^*(-u, -v)$$

$$|F(u, v)| = |F(-u, -v)|$$

27

Convolution

- * Continuous and discrete convolution

$$f(x, y) * g(x, y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(\alpha, \beta) g(x - \alpha, y - \beta) d\alpha d\beta$$

$$f_e(x, y) * g_e(x, y) = \frac{1}{MN} \sum_{m=0}^{M-1} \sum_{n=0}^{N-1} f_e(m, n) g_e(x - m, y - n)$$

- * The convolution theorem

$$f(x, y) * g(x, y) \Leftrightarrow F(u, v) G(u, v)$$

$$f(x, y) g(x, y) \Leftrightarrow F(u, v) * G(u, v)$$

- * Practically, computing the discrete convolution in the frequency domain often is more efficient than doing it in the spatial domain directly

31

Correlation

- * Continuous and discrete correlation

$$f(x, y) \circ g(x, y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(\alpha, \beta) g(x + \alpha, y + \beta) d\alpha d\beta$$

$$f_e(x, y) \circ g_e(x, y) = \frac{1}{MN} \sum_{m=0}^{M-1} \sum_{n=0}^{N-1} f_e(m, n) g_e(x + m, y + n)$$

- * The correlation theorem

$$f(x, y) \circ g(x, y) \Leftrightarrow F^*(u, v) G(u, v)$$

$$f^*(x, y) g(x, y) \Leftrightarrow F(u, v) \circ G(u, v)$$

32

Correlation (cont ')

- * Autocorrelation vs. cross correlation

- * Autocorrelation theorem

$$F\{f(x, y) \circ f(x, y)\} = |F(u, v)|^2$$

- * Application: template or prototype matching

33

Practical issues – Implement convolution in frequency domain

* In spatial domain

* In frequency domain

- $f * g \leftrightarrow F(f)G(g)$
- Phase? Mag?
- How to pad?

34

FIGURE 4.36 Left: convolution of two discrete functions. Right: convolution of the same functions, taking into account the implied periodicity of the DFT. Note in (j) how data from adjacent periods corrupt the result of convolution.

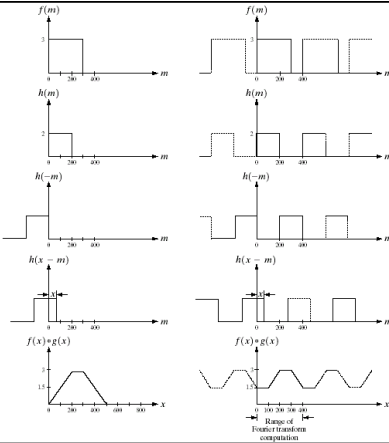

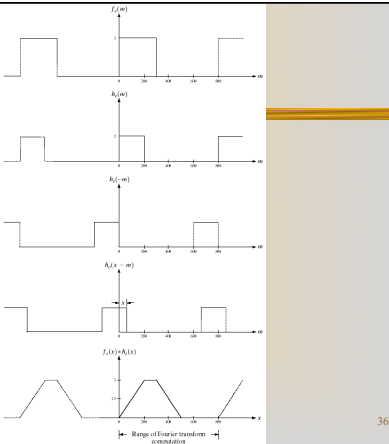

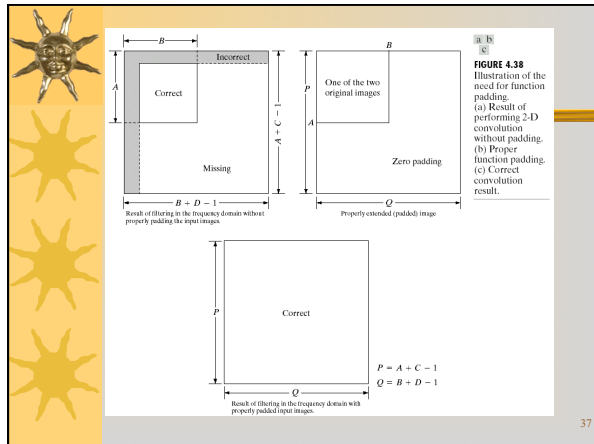

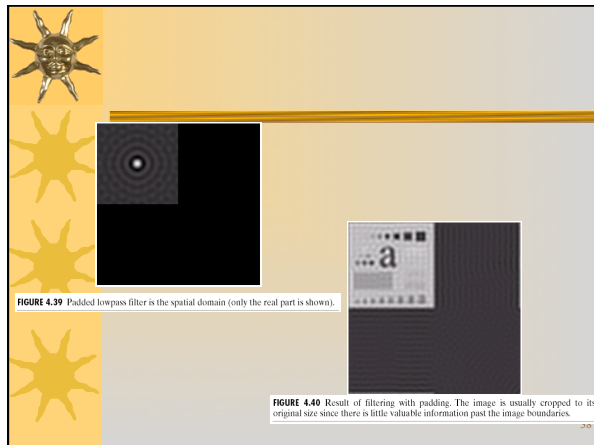

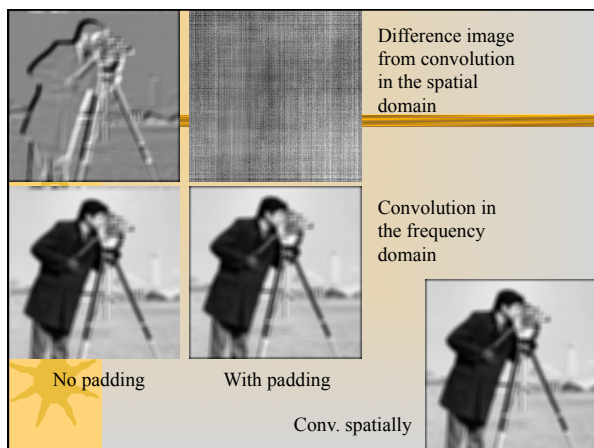

FIGURE 4.37 Result of padding convolution with extended functions. Compare Figs. 4.36(c) and 4.36(c).

36

Different enhancement approaches

- * Lowpass filter
- * Highpass filter
- * Homomorphic filter

40

Lowpass filtering

- * Ideal filter

$$H(u, v) = \begin{cases} 1 & \text{if } D(u, v) \leq D_0 \\ 0 & \text{if } D(u, v) > D_0 \end{cases}$$
 - $D(u, v)$: distance from point (u, v) to the origin
 - cutoff frequency (D_0)
 - nonphysical
 - radially symmetric about the origin

- * Butterworth filter

$$H(u, v) = \frac{1}{1 + [D(u, v)/D_0]^n}$$

- * Gaussian lowpass filter

$$H(u, v) = e^{-D^2(u, v)/2D_0^2}$$

41

FIGURE 4.10 (a) Perspective plot of an ideal lowpass filter transfer function. (b) Filter displayed as an image. (c) Filter radial cross section.

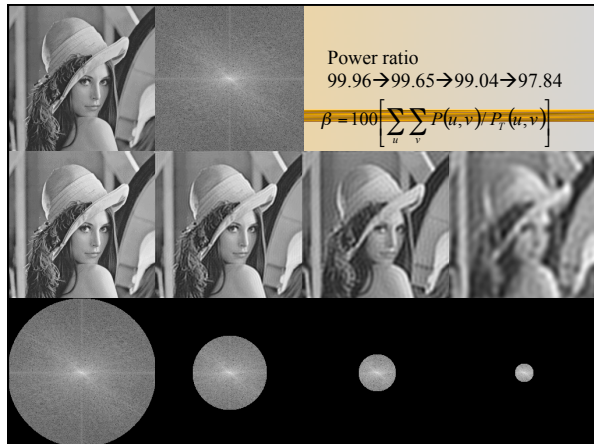

FIGURE 4.14 (a) Perspective plot of a Butterworth lowpass filter transfer function. (b) Filter displayed as an image. (c) Filter radial cross sections of orders 1 through 4.

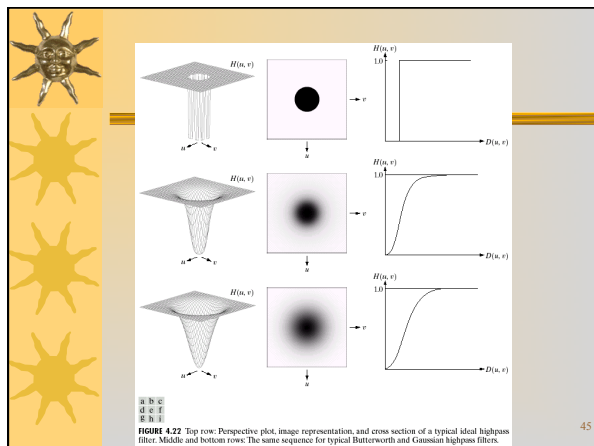

42

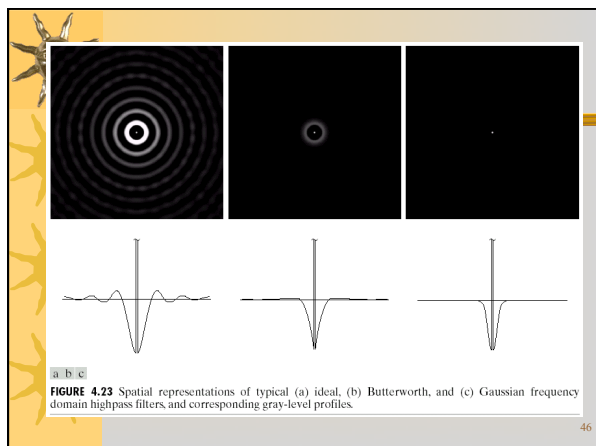

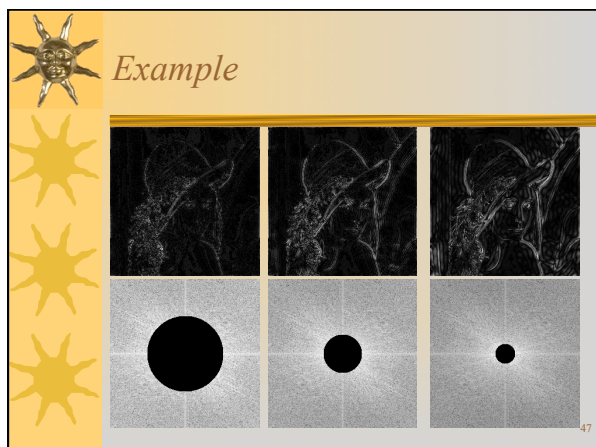

Highpass filter

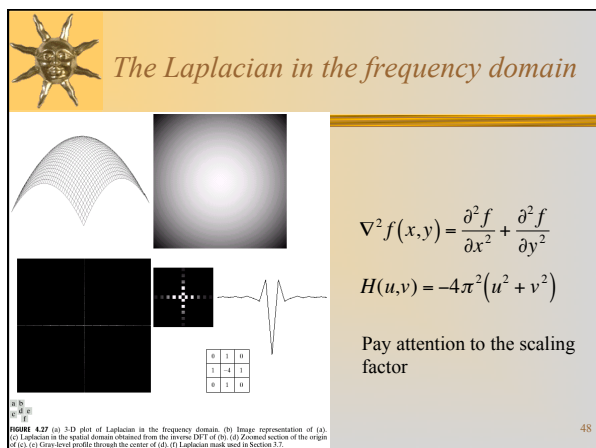

- ★ Ideal filter $H(u,v) = \begin{cases} 0 & \text{if } D(u,v) \leq D_0 \\ 1 & \text{if } D(u,v) > D_0 \end{cases}$
- ★ Butterworth filter $H(u,v) = \frac{1}{1 + [D_0 / D(u,v)]^n}$
- ★ Gaussian highpass filter $H(u,v) = 1 - e^{-D^2(u,v) / 2D_0^2}$

44

$$\nabla^2 f(x,y) = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$$

$$H(u,v) = -4\pi^2(u^2 + v^2)$$

Pay attention to the scaling factor

UM in the frequency domain

$$g(x,y) = f(x,y) + k * g_{mask}(x,y) = f(x,y) + k * (f(x,y) - f_{LP}(x,y))$$

$$g(x,y) = \mathfrak{F}^{-1}\{[1 + k * H_{HP}(u,v)]F(u,v)\}$$

49

Homomorphic filtering

* A simple image model

- $f(x,y)$: the intensity is called the **gray level** for monochrome image
- $f(x,y) = i(x,y) \cdot r(x,y)$
- $0 < i(x,y) < \infty$, the illumination
- $0 < r(x,y) < 1$, the reflectance

50

Homomorphic filter (cont')

$$f(x,y) = i(x,y) \cdot r(x,y)$$

$$z(x,y) = \ln f(x,y) = \ln i(x,y) + \ln r(x,y)$$

$$F\{z(x,y)\} = F\{\ln i(x,y)\} + F\{\ln r(x,y)\}$$

$$Z(u,v) = F_i(u,v) + F_r(u,v)$$

$$S(u,v) = H(u,v)F_i(u,v) + H(u,v)F_r(u,v)$$

$$s(x,y) = i'(x,y) + r'(x,y)$$

$$g(x,y) = \exp[s(x,y)] = \exp[i'(x,y)] \exp[r'(x,y)]$$

51

Homomorphic filter (cont')

- * The illumination component
 - Slow spatial variations
 - Low frequency
- * The reflectance component
 - Vary abruptly, particularly at the junctions of dissimilar objects
 - High frequency
- * Homomorphic filters
 - Affect low and high frequencies differently
 - Compress the low frequency dynamic range
 - Enhance the contrast in high frequency

52

Homomorphic Filter (cont')

FIGURE 4.32 Cross section of a circularly symmetric filter function, $D(u, v)$ is the distance from the origin of the centered transform.

$$\gamma_H > 1$$

$$\gamma_L < 1$$

$$H(u, v) = (\gamma_H - \gamma_L)[1 - e^{-c(D^2(u, v)/D_0^2)}] + \gamma_L$$

53
