Alternatives to Self-Organization

- Leader
 - directs building activity of group
- Blueprint (image of completion)
 - compact representation of spatial/temporal relationships of parts
- Recipe (program)
 - sequential instructions specify spatial/temporal actions of individual
- Template
 - full-sized guide or mold that specifies final pattern

2012/4/16 7

Basic Mechanism of Construction (Stigmergy)

- Worker picks up soil granule
- Mixes saliva to make cement
- Cement contains pheromone
- Other workers attracted by pheromone to bring more granules
- There are also trail and queen pheromones

Construction of Arch (3)

2012/4/16 12
Fig. from Bonabeau, Dorigo & Theraulaz

Basic Principles

- Continuous (quantitative) stigmergy
- Positive feedback:
 - via pheromone deposition
- Negative feedback:
 - depletion of soil granules & competition between pillars
 - pheromone decay

2012/4/16 13

Deneubourg Model

- $H(r, t)$ = concentration of cement pheromone in air at location r & time t
- $P(r, t)$ = amount of deposited cement with still active pheromone at r, t
- $C(r, t)$ = density of laden termites at r, t
- Φ = constant flow of laden termites into system

2012/4/16 14

Equation for P (Deposited Cement with Pheromone)

$\partial_t P$ (rate of change of active cement) =
 $k_1 C$ (rate of cement deposition by termites)
 – $k_2 P$ (rate of pheromone loss to air)

$$\partial_t P = k_1 C - k_2 P$$

2012/4/16 15

Equation for H (Concentration of Pheromone)

$\partial_t H$ (rate of change of concentration) =
 $k_2 P$ (pheromone from deposited material)
 – $k_4 H$ (pheromone decay)
 + $D_H \nabla^2 H$ (pheromone diffusion)

$$\partial_t H = k_2 P - k_4 H + D_H \nabla^2 H$$

2012/4/16 16

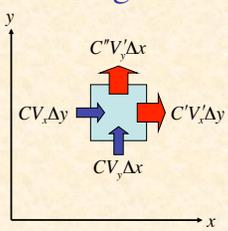

Equation for C (Density of Laden Termites)

$\partial_t C$ (rate of change of concentration) =
 Φ (flux of laden termites)
 – $k_1 C$ (unloading of termites)
 + $D_C \nabla^2 C$ (random walk)
 – $\gamma \nabla \cdot (CVH)$ (chemotaxis: response to pheromone gradient)

$$\partial_t C = \Phi - k_1 C + D_C \nabla^2 C - \gamma \nabla \cdot (CVH)$$

2012/4/16 17

Explanation of Divergence

- velocity field = $\mathbf{V}(x,y) = \mathbf{i}V_x(x,y) + \mathbf{j}V_y(x,y)$
- $C(x,y)$ = density
- outflow rate = $\Delta_x(CV_x) \Delta y + \Delta_y(CV_y) \Delta x$
- outflow rate / unit area = $\frac{\Delta_x(CV_x)}{\Delta x} + \frac{\Delta_y(CV_y)}{\Delta y}$

$$\rightarrow \frac{\partial(CV_x)}{\partial x} + \frac{\partial(CV_y)}{\partial y} = \nabla \cdot CV$$

2012/4/16 18

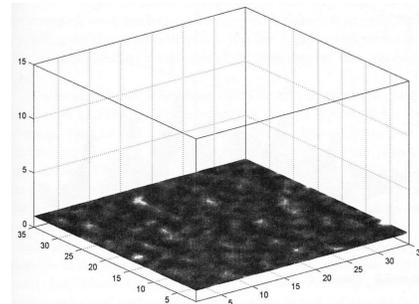

Explanation of Chemotaxis Term

- The termite flow *into* a region is the *negative* divergence of the flux through it
 $-\nabla \cdot \mathbf{J} = -(\partial J_x / \partial x + \partial J_y / \partial y)$
- The flux velocity is proportional to the pheromone gradient
 $\mathbf{J} \propto \nabla H$
- The flux density is proportional to the number of moving termites
 $\mathbf{J} \propto C$
- Hence, $-\gamma \nabla \cdot \mathbf{J} = -\gamma \nabla \cdot (C \nabla H)$

22

Conditions for Self-Organized Pillars

- Will not produce regularly spaced pillars if:
 - density of termites is too low
 - rate of deposition is too low
- A homogeneous stable state results

$$C_0 = \frac{\Phi}{k_1}, \quad H_0 = \frac{\Phi}{k_4}, \quad P_0 = \frac{\Phi}{k_2}$$

24

Interaction of Three Pheromones

- Queen pheromone governs size and shape of queen chamber (template)
- Cement pheromone governs construction and spacing of pillars & arches (stigmergy)
- Trail pheromone:
 - attracts workers to construction sites (stigmergy)
 - encourages soil pickup (stigmergy)
 - governs sizes of galleries (template)

30

Discrete vs. Continuous Stigmergy

- Recall: *stigmergy* is the coordination of activities through the environment
- Continuous* or *quantitative* stigmergy
 - quantitatively different stimuli trigger quantitatively different behaviors
- Discrete* or *qualitative* stigmergy
 - stimuli are classified into distinct classes, which trigger distinct behaviors

2012/4/16 31

Discrete Stigmergy in Comb Construction

- Initially all sites are equivalent
- After addition of cell, qualitatively different sites created

Numbers and Kinds of Building Sites

2012/4/16 Fig. from Self-Org. Biol. Sys. 33

Lattice Swarm Model

- Random movement by wasps in a 3D lattice
 - cubic or hexagonal
- Wasps obey a 3D CA-like rule set
- Depending on configuration, wasp deposits one of several types of “bricks”
- Once deposited, it cannot be removed
- May be deterministic or probabilistic
- Start with a single brick

2012/4/16 34

Cubic Neighborhood

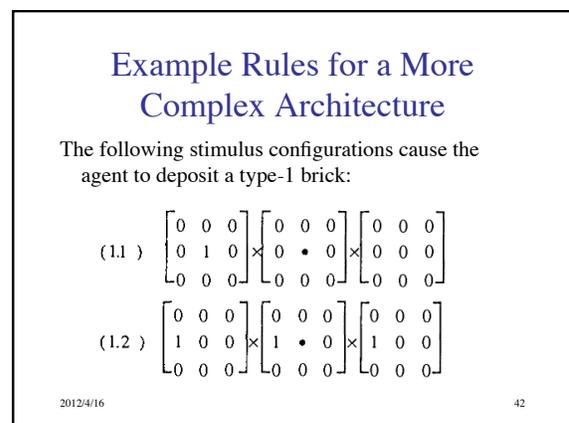

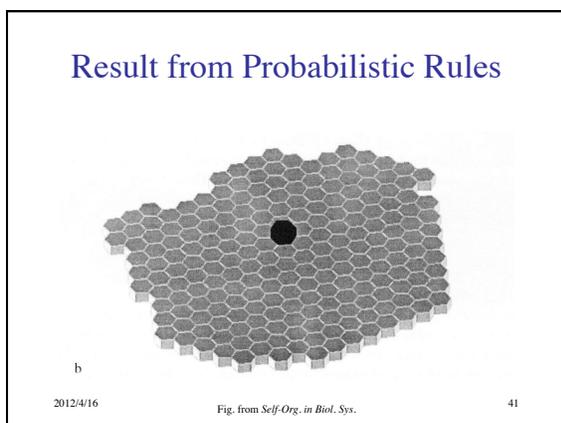

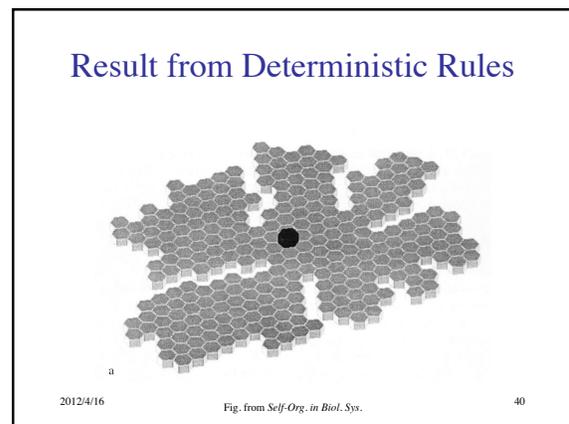

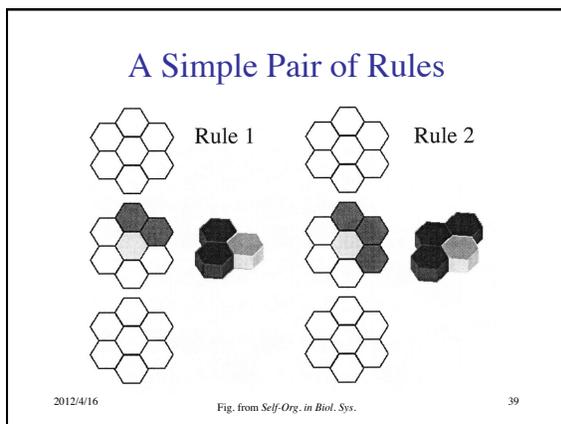

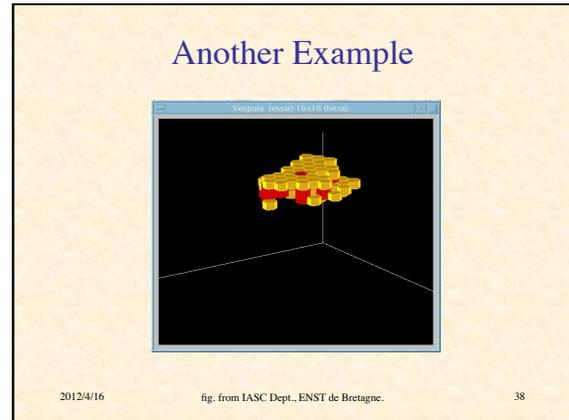

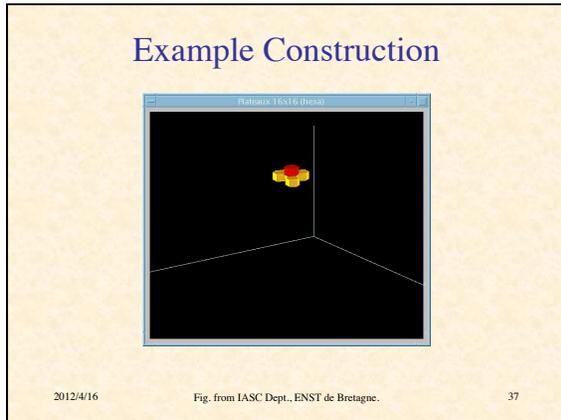

- Deposited brick depends on states of 26 surrounding cells
- Configuration of surrounding cells may be represented by matrices:

$$\begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 \\ 1 & \bullet & 0 \\ 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Effects of Randomness (Coordinated Algorithm)

- Specifically different (i.e., different in details)
- Generically the same (qualitatively identical)
- Sometimes results are fully constrained

2012/4/16 Fig. from Bonabeau & al., *Swarm Intell.* 55

Effects of Randomness (Non-coordinated Algorithm)

2012/4/16 Fig. from Bonabeau & al., *Swarm Intell.* 56

Non-coordinated Algorithms

- Stimulating configurations are not ordered in time and space
- Many of them overlap
- Architecture grows without any coherence
- May be convergent, but are still unstructured

2012/4/16 57

Coordinated Algorithm

- Non-conflicting rules
 - can't prescribe two different actions for the same configuration
- Stimulating configurations for different building stages cannot overlap
- At each stage, “handshakes” and “interlocks” are required to prevent conflicts in parallel assembly

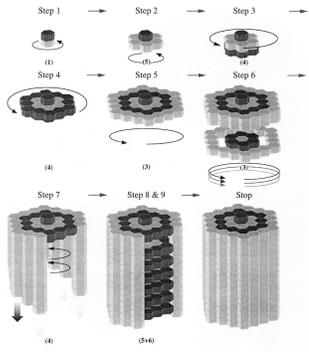

2012/4/16 58

More Formally...

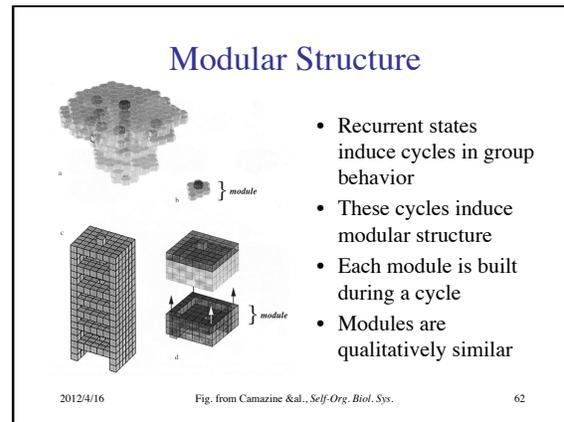

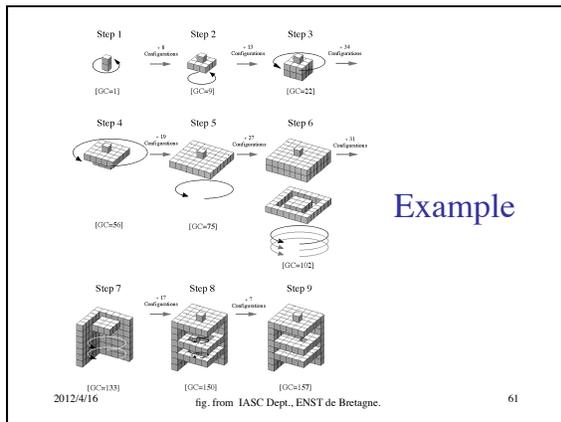

- Let $C = \{c_1, c_2, \dots, c_n\}$ be the set of local stimulating configurations
- Let (S_1, S_2, \dots, S_m) be a sequence of assembly stages
- These stages partition C into mutually disjoint subsets $C(S_p)$
- Completion of S_p signaled by appearance of a configuration in $C(S_{p+1})$

2012/4/16 59

Example

2012/4/16 Fig. from Camazine & al., *Self-Org. Biol. Sys.* 60

Possible Termination Mechanisms

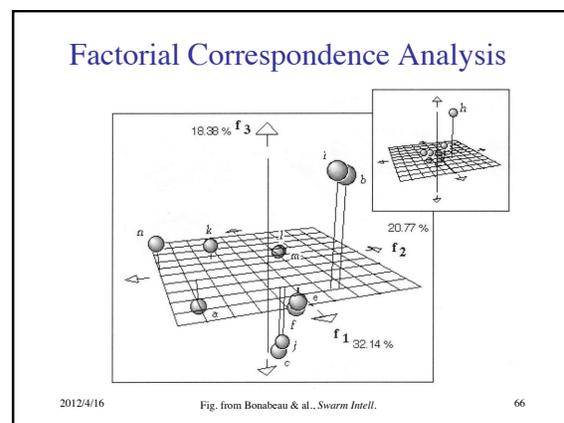

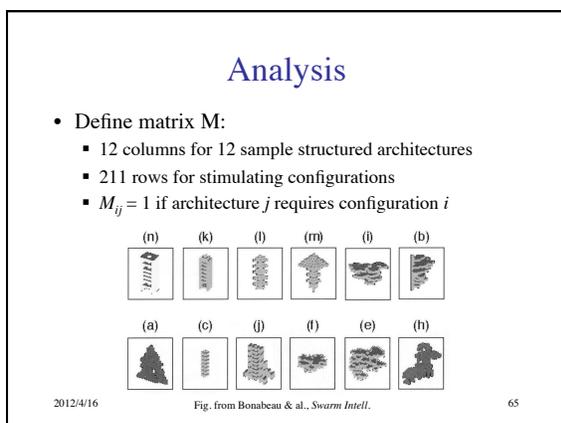

- Qualitative
 - the assembly process leads to a configuration that is not stimulating
- Quantitative
 - a separate rule inhibiting building when nest a certain size relative to population
 - “empty cells rule”: make new cells only when no empties available
 - growing nest may inhibit positive feedback mechanisms

2012/4/16 63

Observations

- Random algorithms tend to lead to uninteresting structures
 - random or space-filling shapes
- Similar structured architectures tend to be generated by similar coordinated algorithms
- Algorithms that generate structured architectures seem to be confined to a small region of rule-space

2012/4/16 64

Conclusions

- Simple rules that exploit discrete (qualitative) stigmergy can be used by autonomous agents to assemble complex, 3D structures
- The rules must be non-conflicting and coordinated according to stage of assembly
- The rules corresponding to interesting structures occupy a comparatively small region in rule-space
