

# Chapter 12

---

## Entity-Relationship Modeling

# Objectives for This Lecture

---

- ◆ **Basic concepts associated with ER model.**
- ◆ **Diagrammatic technique for displaying ER model using Unified Modeling Language (UML).**
- ◆ **How to identify and resolve problems with ER models called connection traps.**

# Concepts of the ER Model

---

- ◆ **Entity types**
- ◆ **Relationship types**
- ◆ **Attributes**

# Entity Type

---

- ◆ **Entity: Group of objects with same properties, identified by enterprise as having an independent existence.**

# Examples of Entity Types

---

## Physical existence

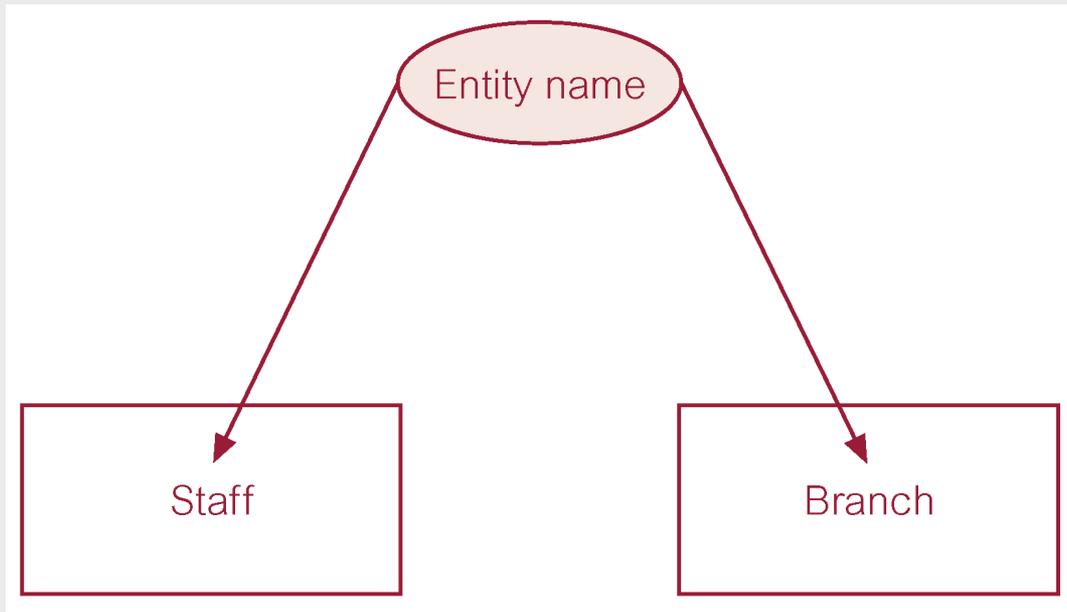

Staff	Part
Property	Supplier
Customer	Product

## Conceptual existence

Viewing	Sale
Inspection	Work experience

# ER diagram of Staff and Branch entity types

---

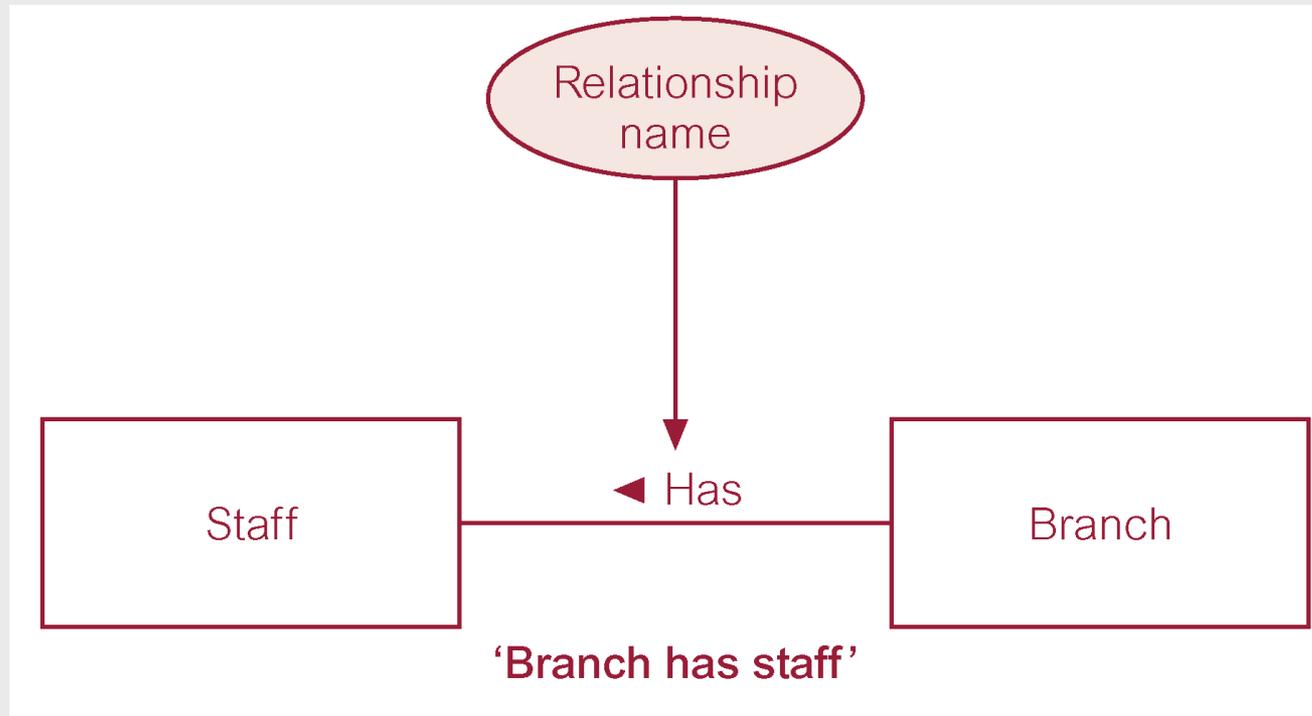

# Relationship Types

---

- ◆ **Relationship: A meaningful association among entity types.**
- ◆ **Represented in relations by foreign keys**

# ER diagram of Branch *Has* Staff relationship

---

# Relationship Types

---

- ◆ **Degree of a Relationship**
  - **Number of participating entities in relationship.**
- ◆ **Relationship of degree :**
  - **two is binary**
  - **three is ternary**
  - **four is quaternary.**

# Binary relationship called *POwns*

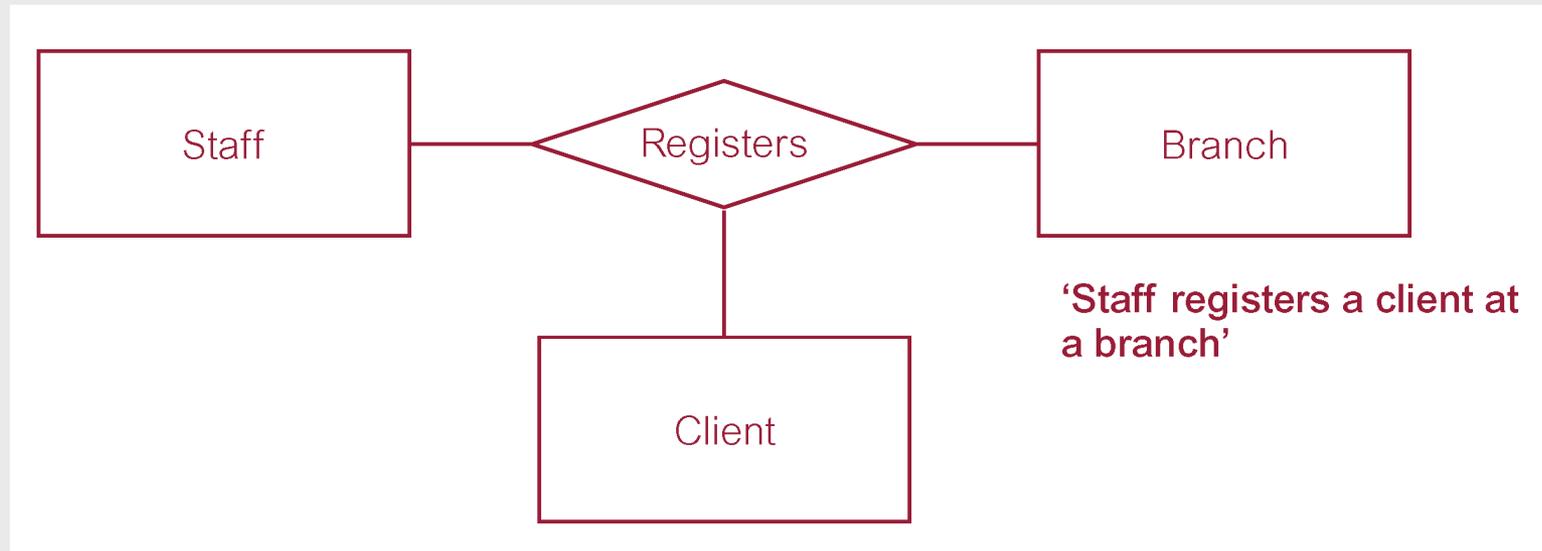

---

'Private owner owns property for rent'

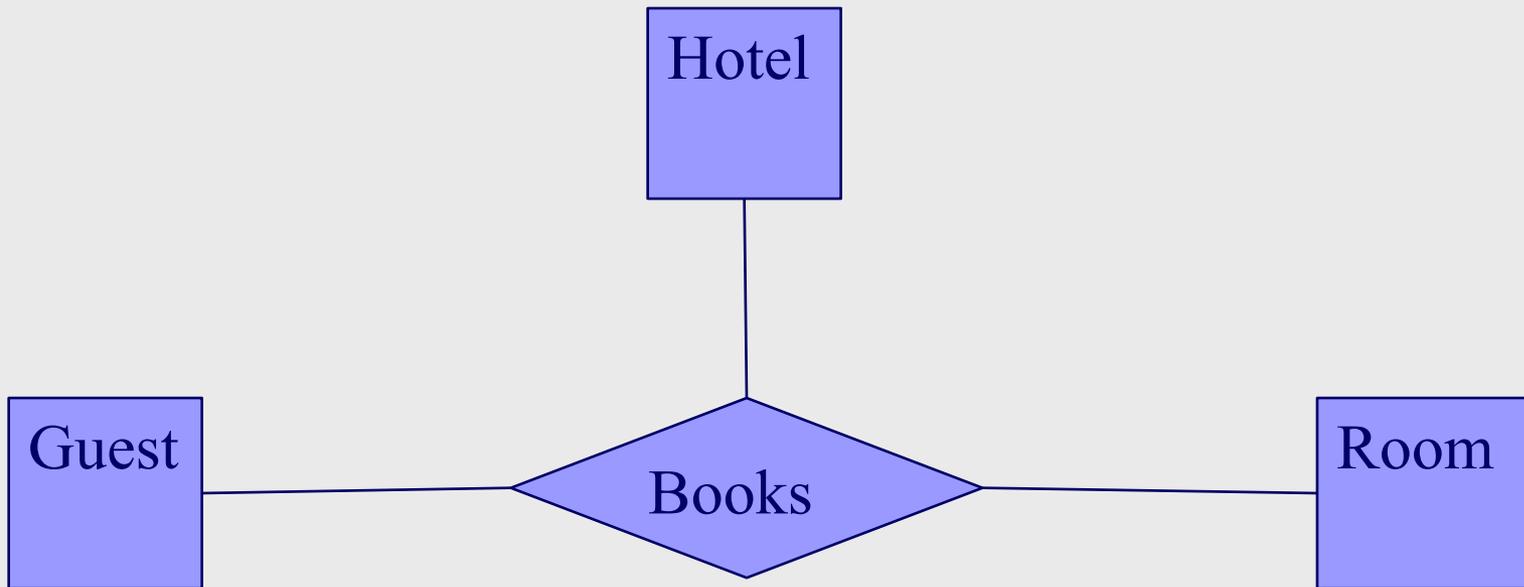

# Ternary relationship called *Registers*

---

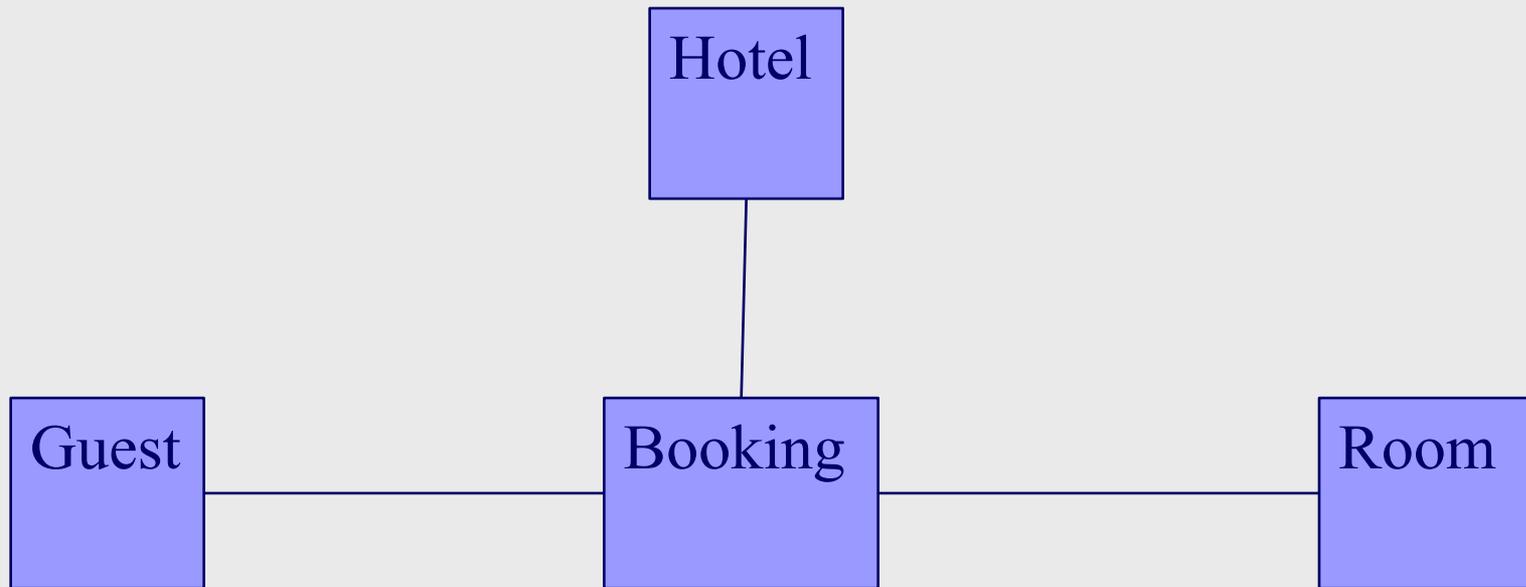

# Another Ternary Relationship

---

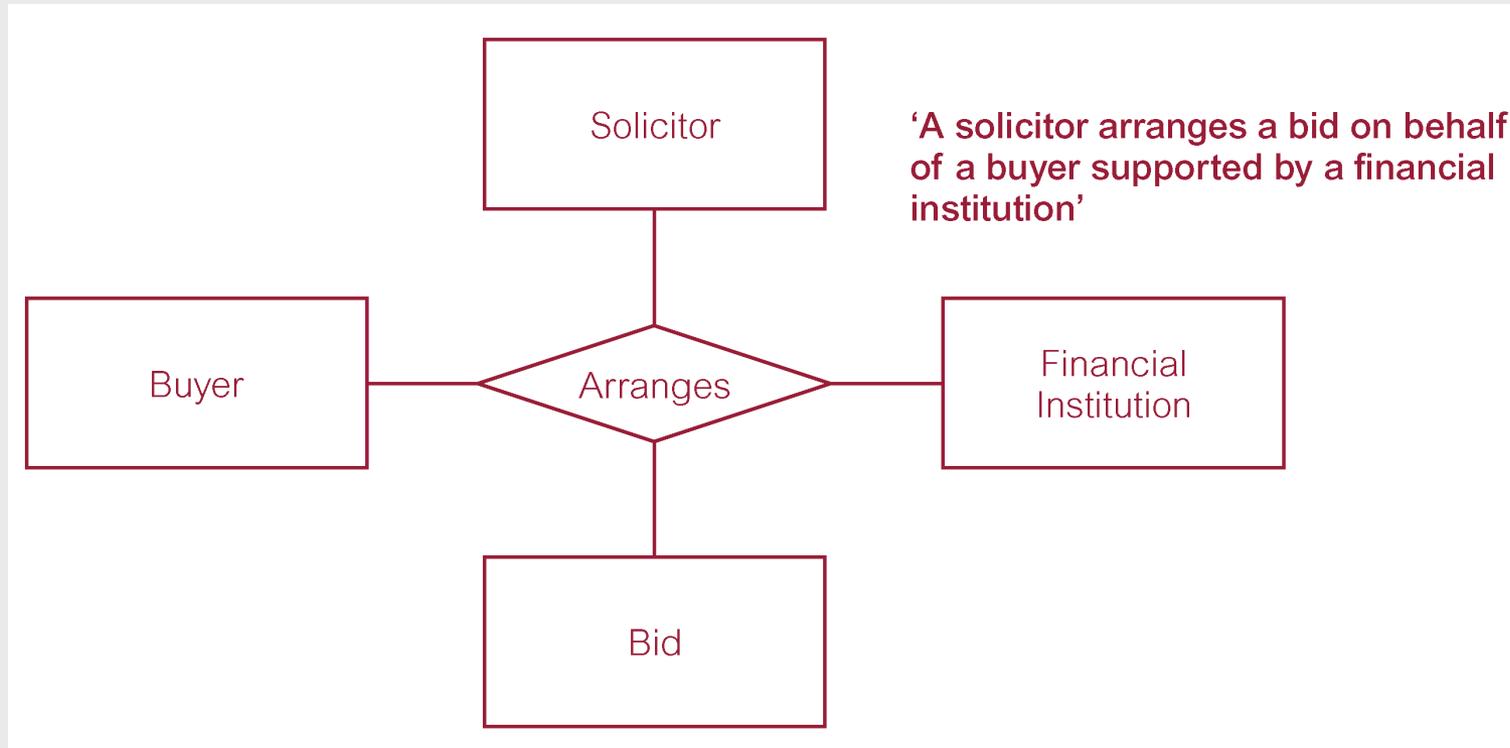

# Wrong way to show a ternary relationship

---

# Quaternary relationship called *Arranges*

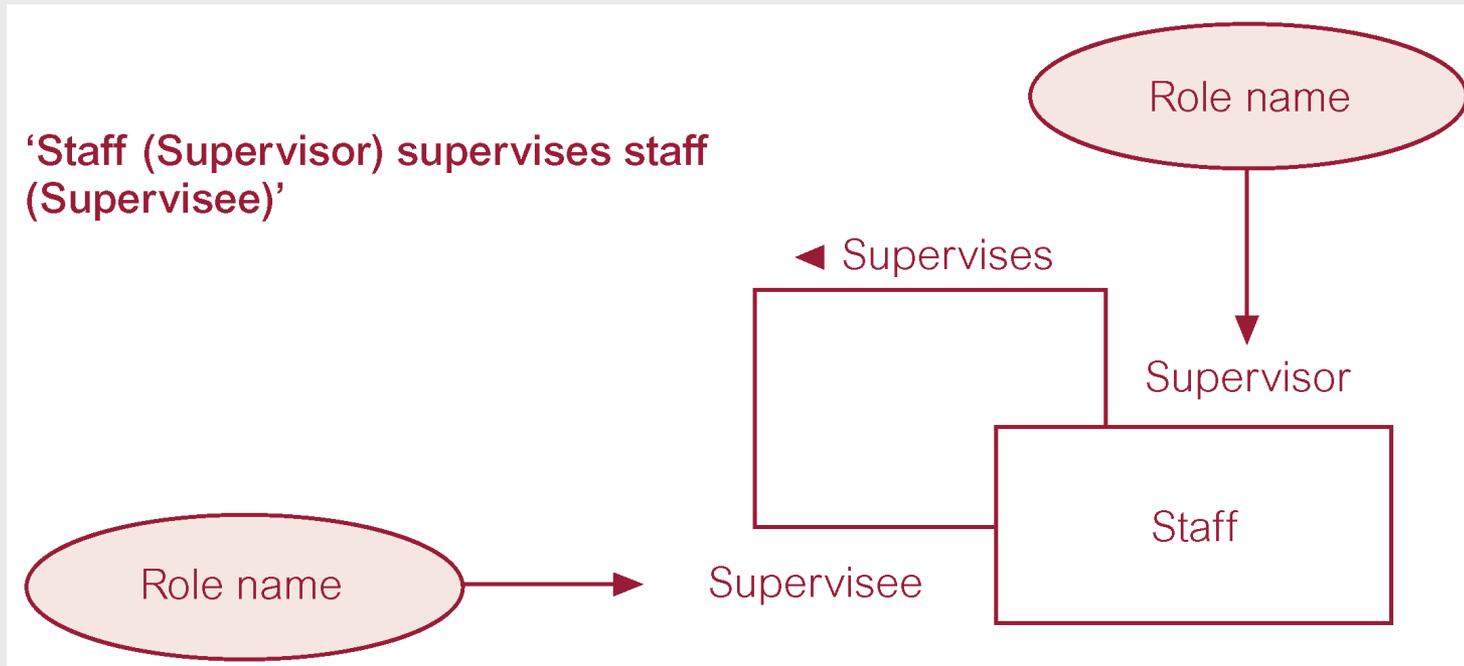

# Relationship Types

---

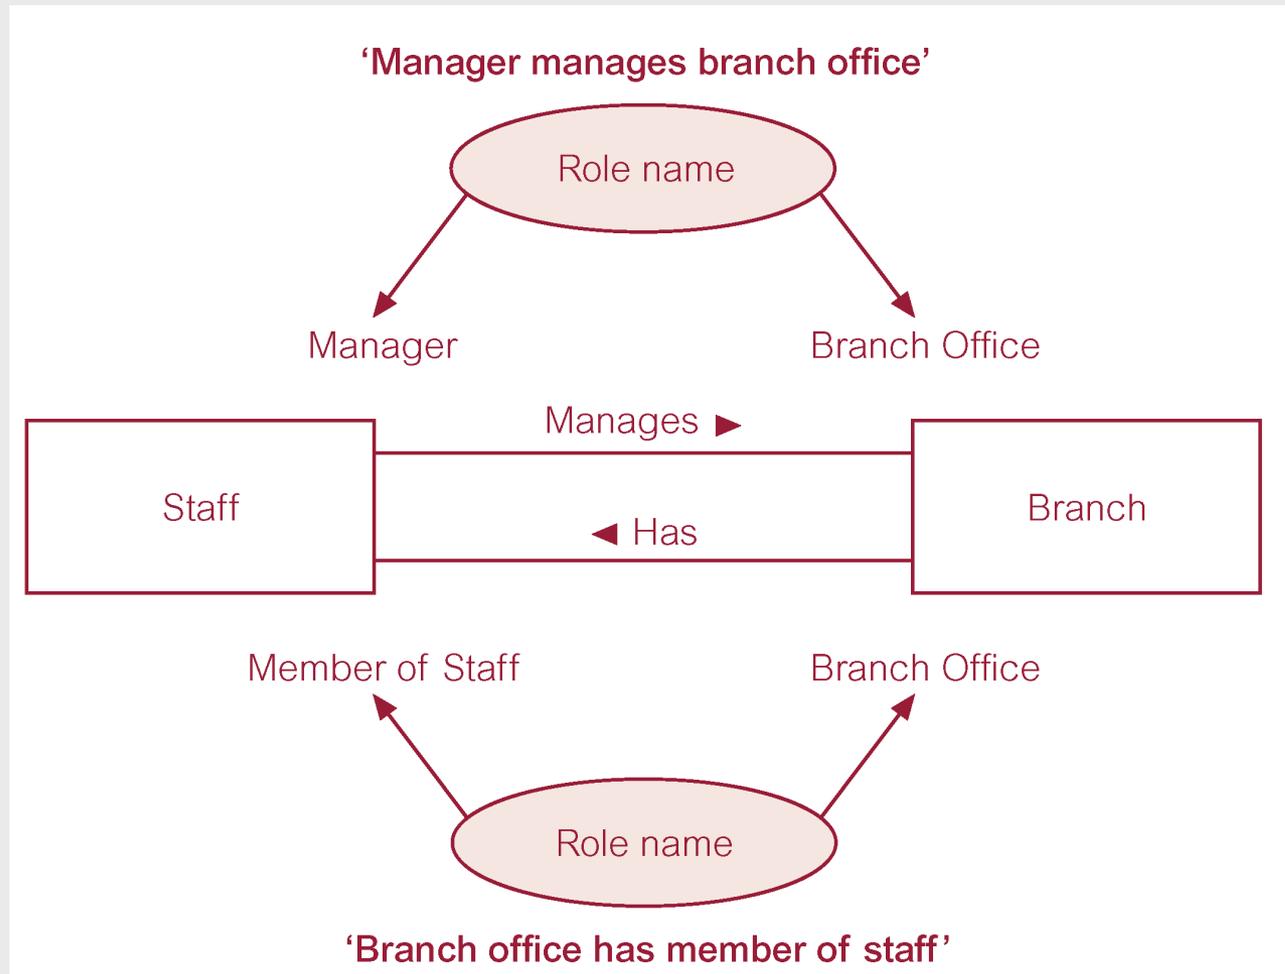

- ◆ **Recursive Relationship**
  - Relationship type where *same* entity type participates more than once in *different roles*.
- ◆ Relationships may be given role names to indicate purpose that each participating entity type plays in a relationship.

# Recursive relationship called *Supervises* with role names

---

# Entities associated through two distinct relationships with role names

# Attributes

---

- ◆ **A property of an entity or a relationship type.**
- ◆ **Types of attributes**
  - » **Descriptive attributes: provide descriptive information about the entity (unstable)**
  - » **Identifying attributes: provide information that uniquely identifies an entity (keys-stable)**
  - » **Foreign key attributes: Provides a link to another entity**

# Attributes

---

- ◆ **Simple Attribute**
  - **Attribute composed of a single component with an independent existence.**
- ◆ **Composite Attribute**
  - **Attribute composed of multiple components, each with an independent existence.**

# Attributes

---

- ◆ **Single-valued Attribute**
  - **Attribute that holds a single value for each occurrence of an entity type.**
- ◆ **Multi-valued Attribute**
  - **Attribute that holds multiple values for each occurrence of an entity type.**
  - **Typically are represented in a separate relation**

# Attributes

---

## ◆ **Derived Attribute**

- **Attribute that represents a value that is derivable from value of a related attribute, or set of attributes, not necessarily in the same entity type.**
- **Derived attributes typically end up in views.**

# Derived attributes (cont)

---

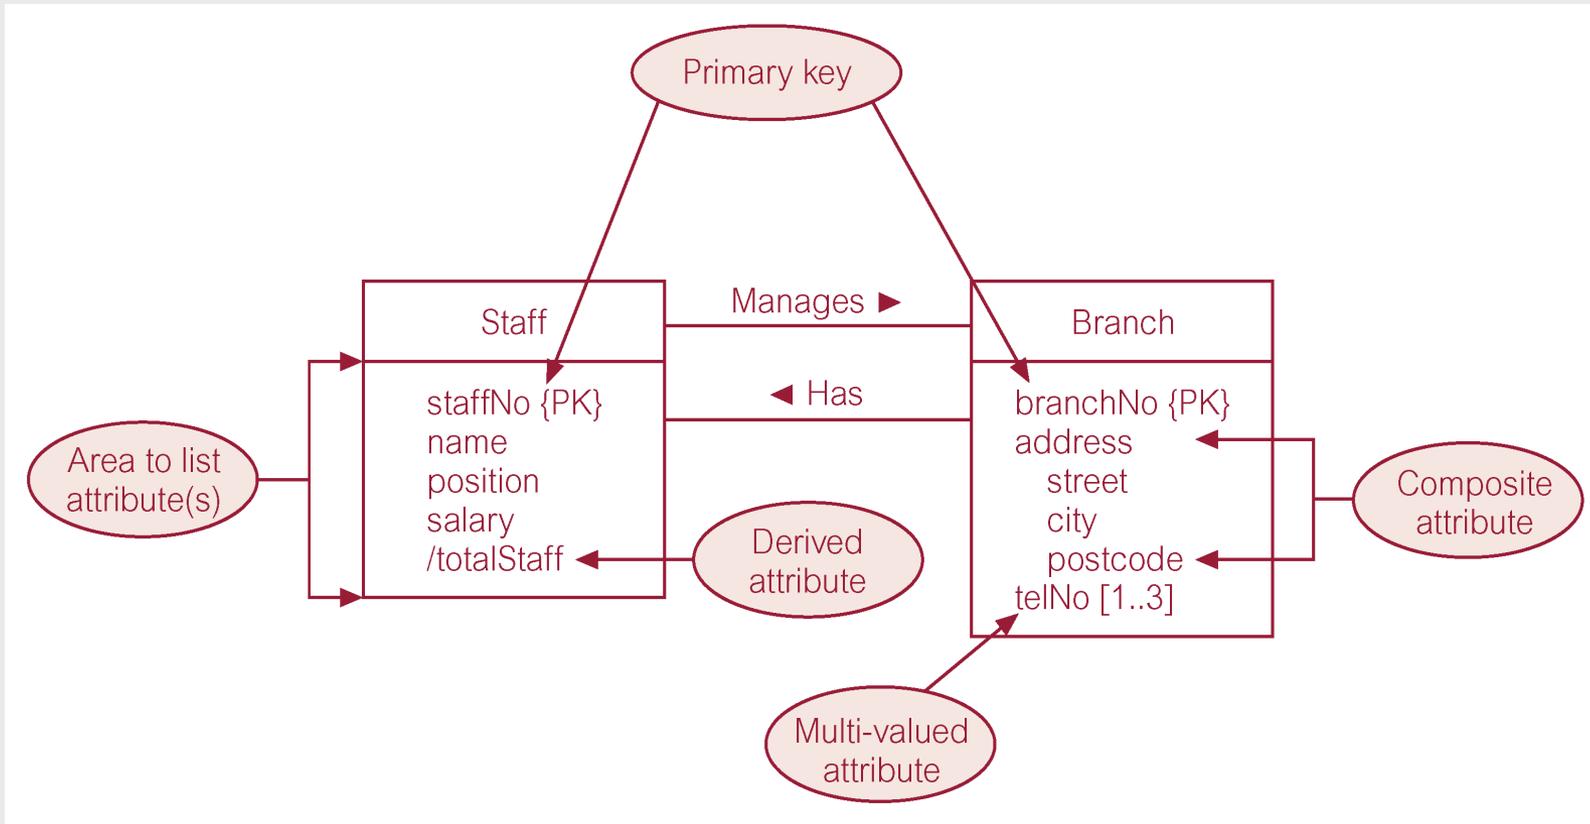

- ◆ Types of derived attributes:
  1. Attributes computed from an aggregate function (e.g., total staff count)
  2. attribute computable from two columns in the same relation (e.g., duration of guest stay can be calculated from dateTo and dateFrom fields of booking relation)
  3. attribute computable from columns that belong to different relations (e.g., cost of guest stay is product of # days from booking and room cost from room)

# Keys

---

- ◆ **Candidate Key**
  - **Minimal set of attributes that uniquely identifies each occurrence of an entity type.**
- ◆ **Primary Key**
  - **Candidate key selected to uniquely identify each occurrence of an entity type.**
- ◆ **Composite Key**
  - **A candidate key that consists of two or more attributes.**

# ER diagram of Staff and Branch entities and their attributes

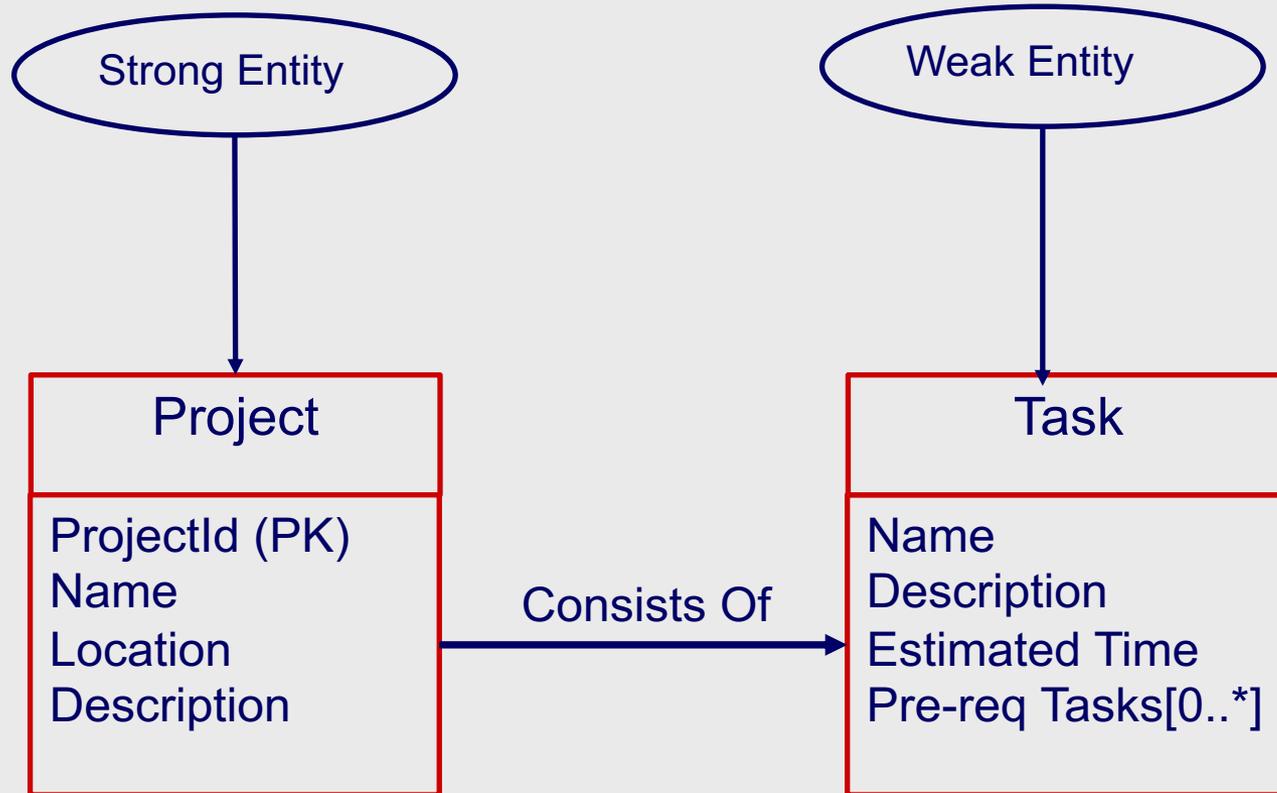

# Entity Type

---

- ◆ **Strong (master) Entity Type**
  - Entity type that is *not* existence-dependent on some other entity type.
- ◆ **Weak (dependent) Entity Type**
  - Entity type that is existence-dependent on some other entity type.

# Strong entity type called Project and weak entity type called Task

---

# Supertype and Subtype Entities

---

- ◆ Supertype Entity: A generic entity that provides a convenient grouping construct for multiple, related sub entities.
  - The sub entities share common attributes that are stored with the supertype entity
- ◆ Subtype Entity: An entity that is a subset of another entity

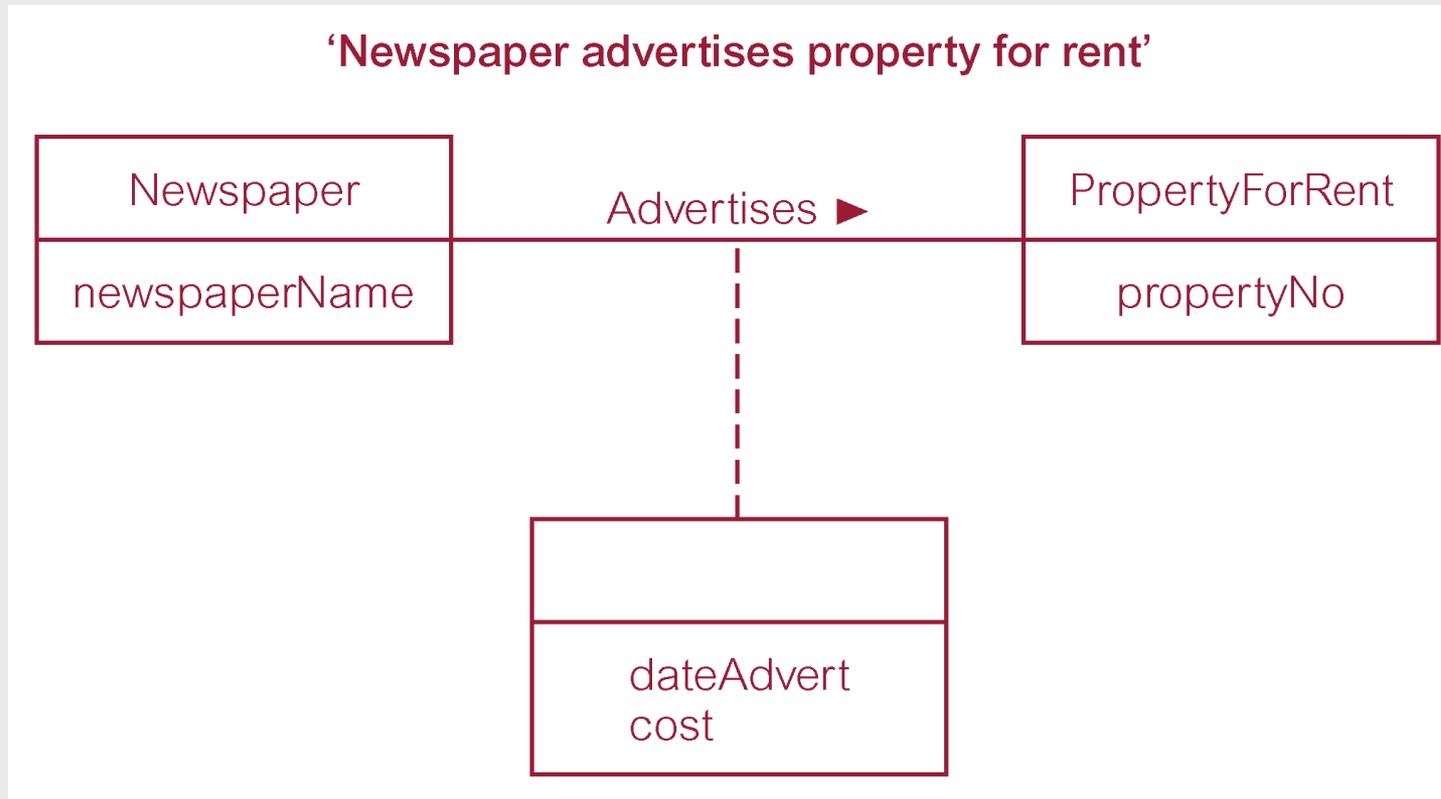

# ER Representation

---

- ◆ Subtypes appear within supertype: Attributes are grouped with the appropriate entity

# Relationship called *Advertises* with attributes

# Structural Constraints

---

- ◆ **Main type of constraint on relationships is called *multiplicity*.**
- ◆ **Multiplicity - number (or range) of possible occurrences of an entity type that may relate to a single occurrence of an associated entity type through a particular relationship.**
- ◆ **Represents policies (called *business rules*) established by user or company.**

# Structural Constraints

---

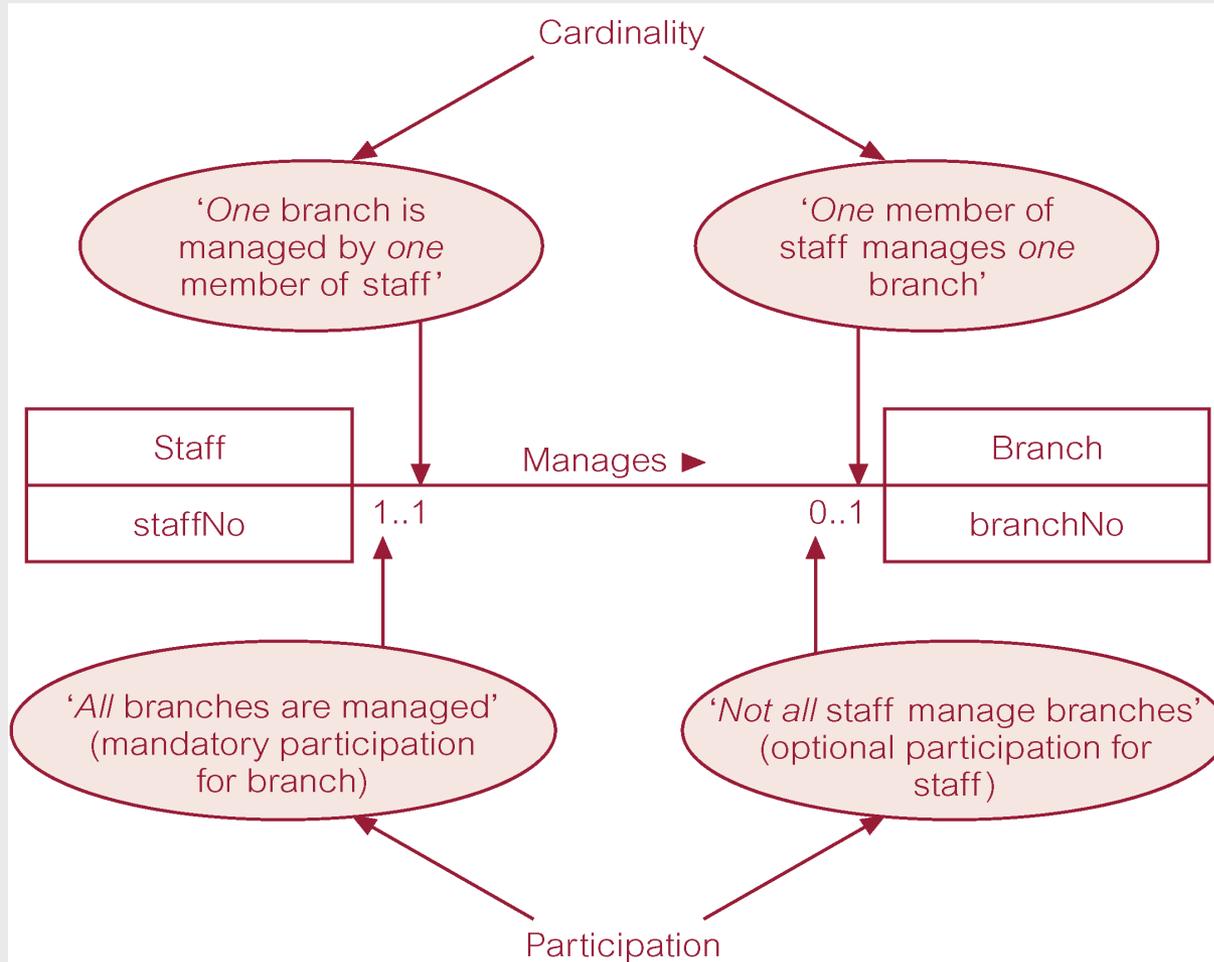

- ◆ Multiplicity is made up of two types of restrictions on relationships: *cardinality* and *participation*.

# Structural Constraints

---

- ◆ **Cardinality**
  - Describes maximum number of possible relationship occurrences for an entity participating in a given relationship type.
- ◆ **Participation**
  - Determines the minimum number of entities that may participate in the relationship.
- ◆ **Example: 0..1:** means that a minimum of 0 and a maximum of 1 entity may occur in the relationship

# Multiplicity as cardinality and participation constraints

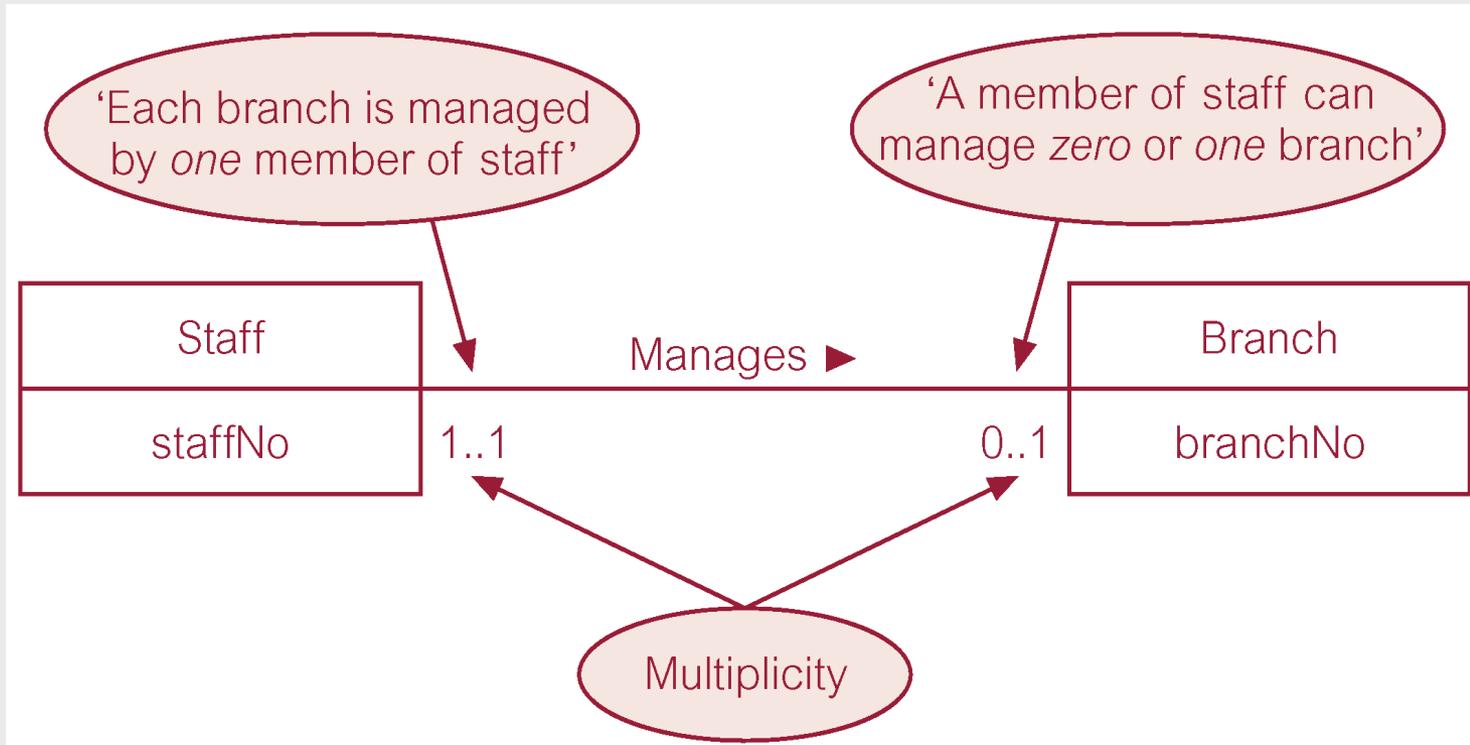

# Structural Constraints

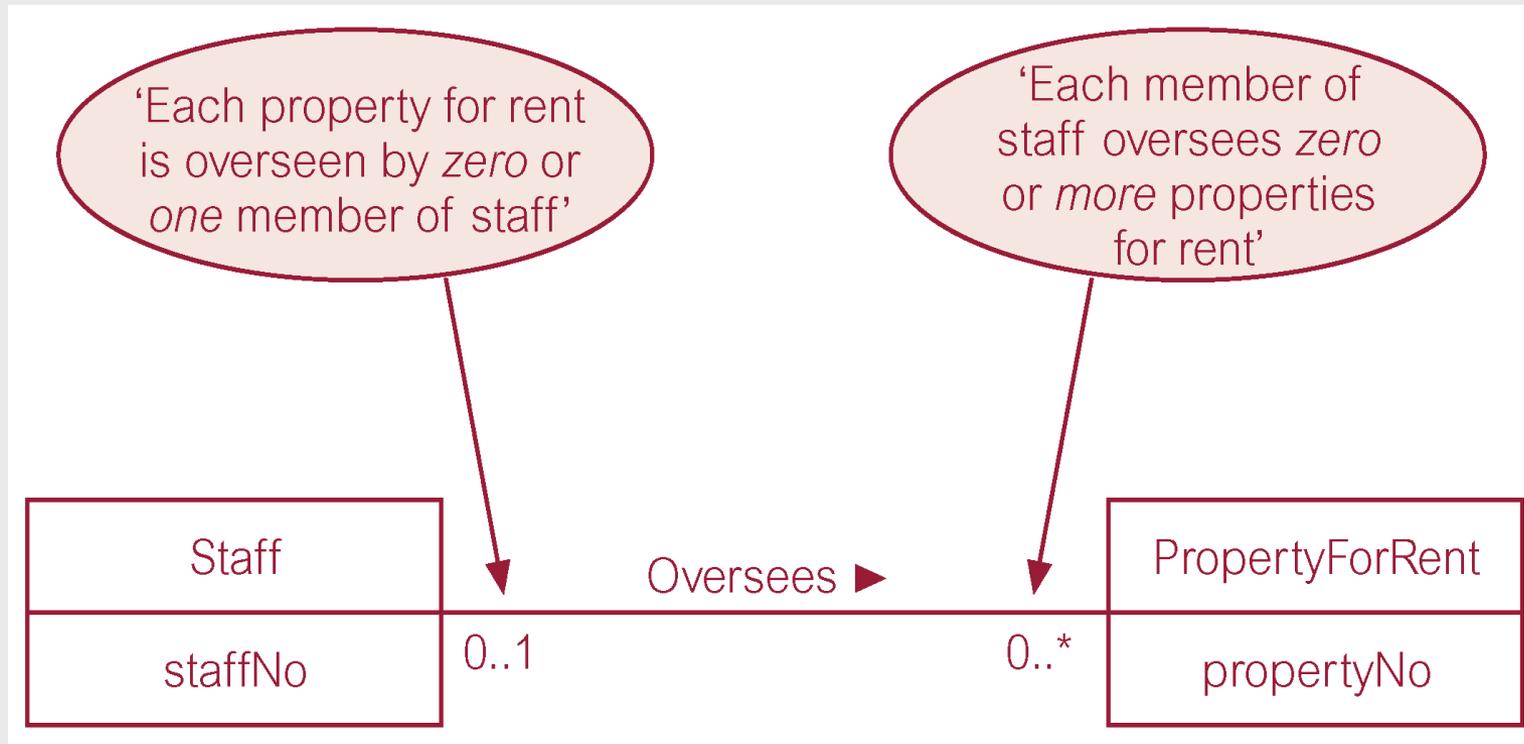

---

- ◆ **The most common degree for relationships is binary.**
- ◆ **Binary relationships are generally referred to as being:**
  - **one-to-one (1:1)**
  - **one-to-many (1:\*)**
  - **many-to-many (\*:\*)**

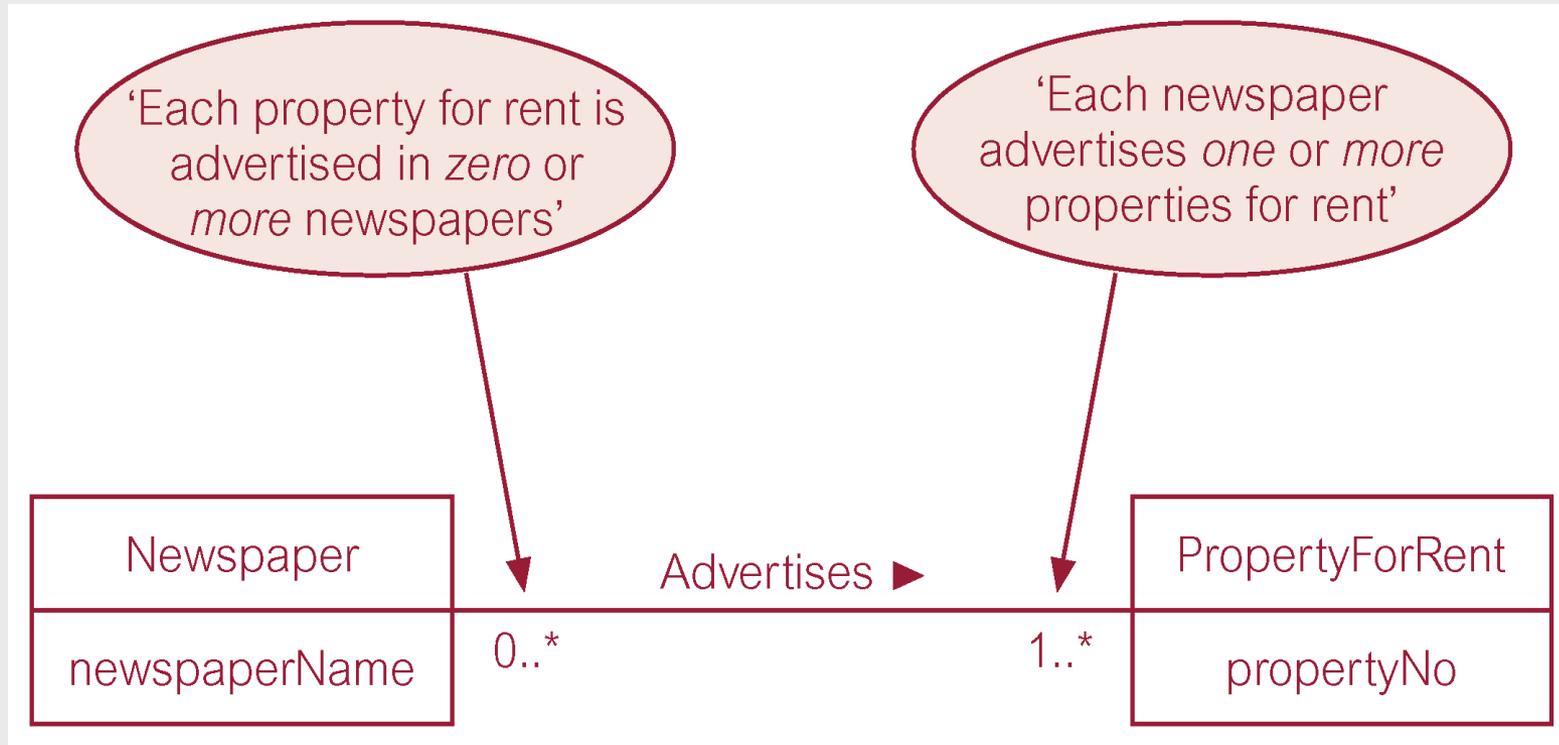

# Multiplicity of Staff *Manages* Branch (1:1) relationship

# Multiplicity of Staff Oversees PropertyForRent (1:\*) relationship type

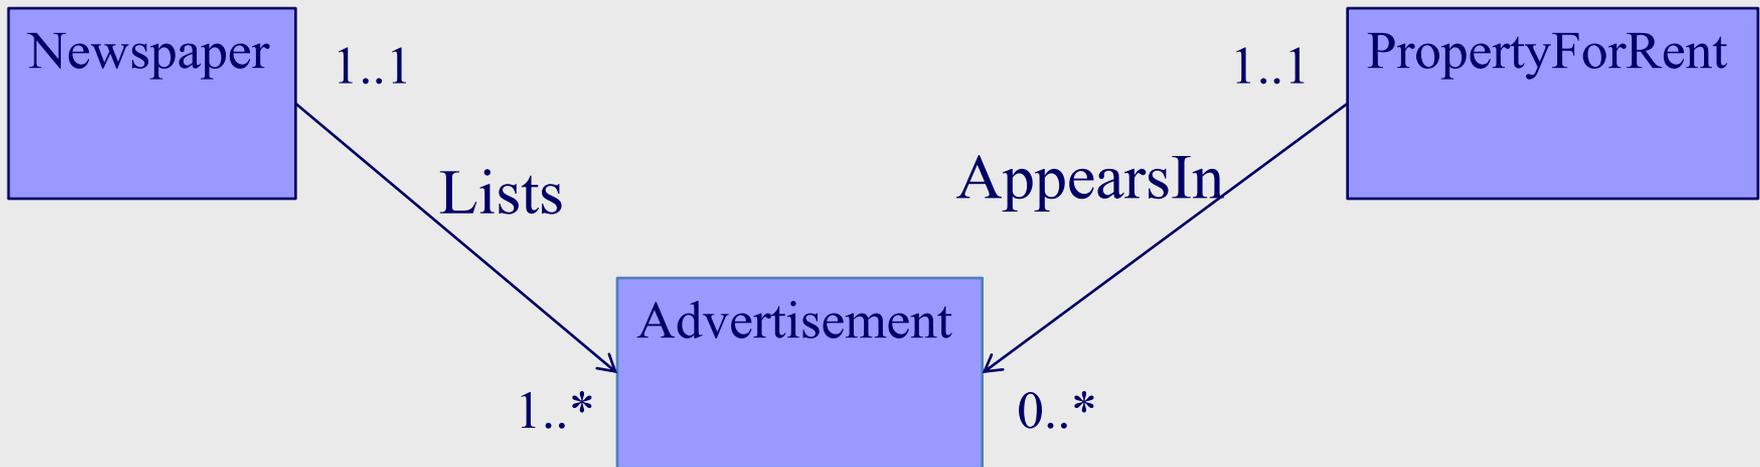

# Multiplicity of Newspaper *Advertises* PropertyForRent (\*:\*) relationship

# The Wrong Way to Show a $^{**}$ Relationship

---

# Structural Constraints

---

## ◆ Multiplicity for Complex Relationships

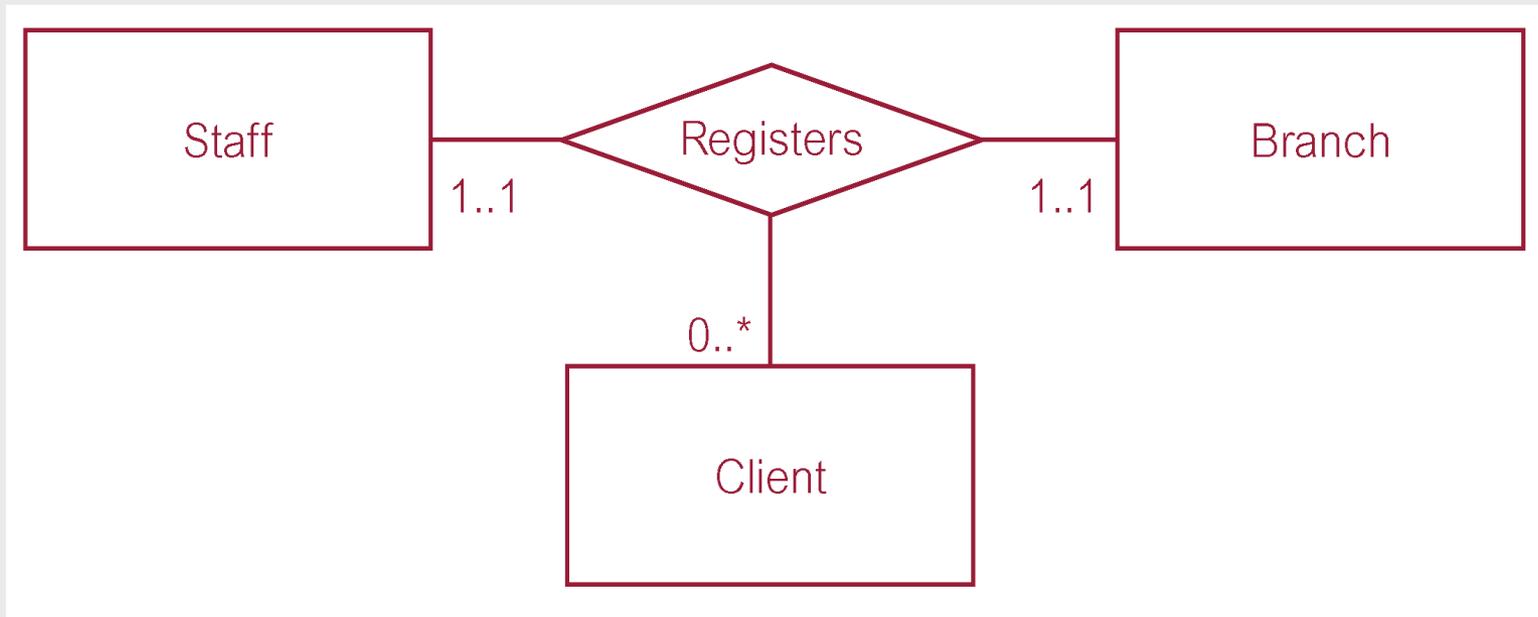

– Number (or range) of possible occurrences of an entity type in an  $n$ -ary relationship when other  $(n-1)$  values are fixed.

– May help to write the relationship as a function.

» Example: There is a relationship  $D$  among 3 entities  $A$ ,  $B$ ,  $C$ .

◆ If  $|D(A,B)| = 0..1$ , then you put  $0..1$  next to  $C$

# Multiplicity of ternary *Registers* relationship

# Summary of multiplicity constraints

---

Alternative ways to represent  
multiplicity constraints

Meaning

0..1

Zero or one entity occurrence

1..1 (or just 1)

Exactly one entity occurrence

0..\* (or just \*)

Zero or many entity occurrences

1..\*

One or many entity occurrences

5..10

Minimum of 5 up to a maximum of 10 entity occurrences

0, 3, 6–8

Zero or three or six, seven, or eight entity occurrences

# Problems with ER Models

---

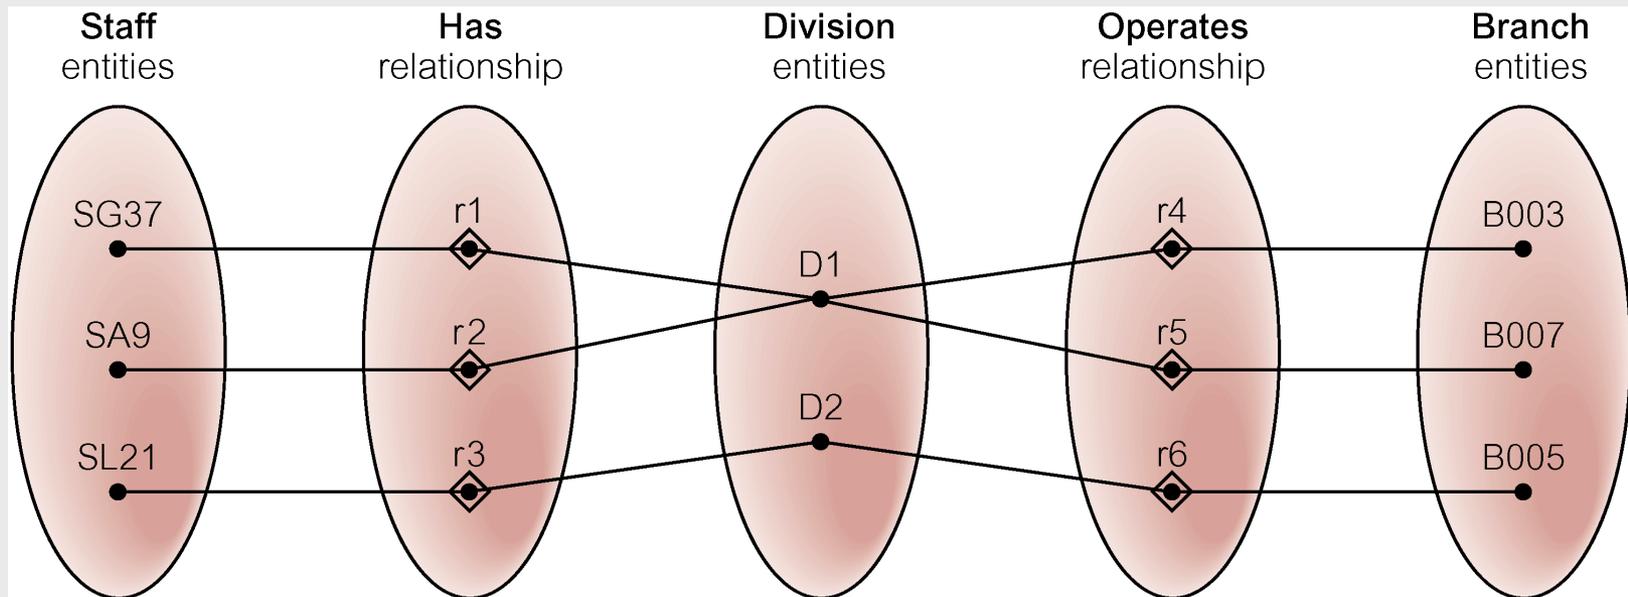

- ◆ **Problems may arise when designing a conceptual data model called *connection traps*.**
- ◆ **Often due to a misinterpretation of the meaning of certain relationships.**
- ◆ **Two main types of connection traps are called *fan traps* and *chasm traps*.**

# An Example of a Fan Trap

---

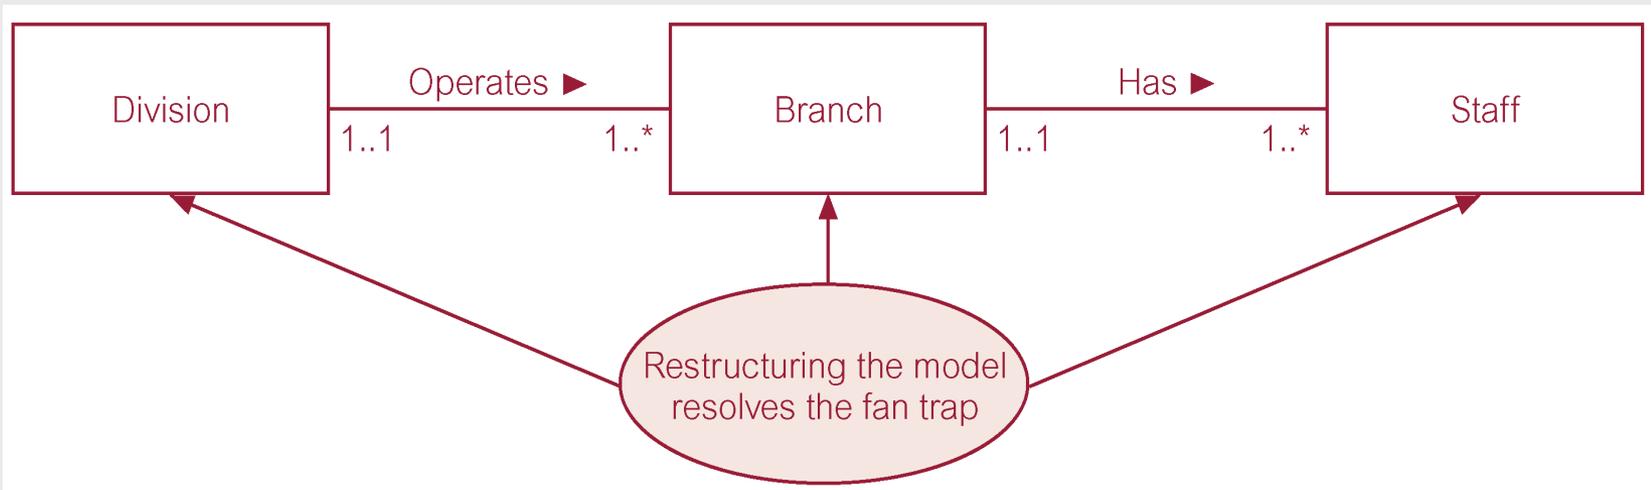

# Semantic Net of ER Model with Fan Trap

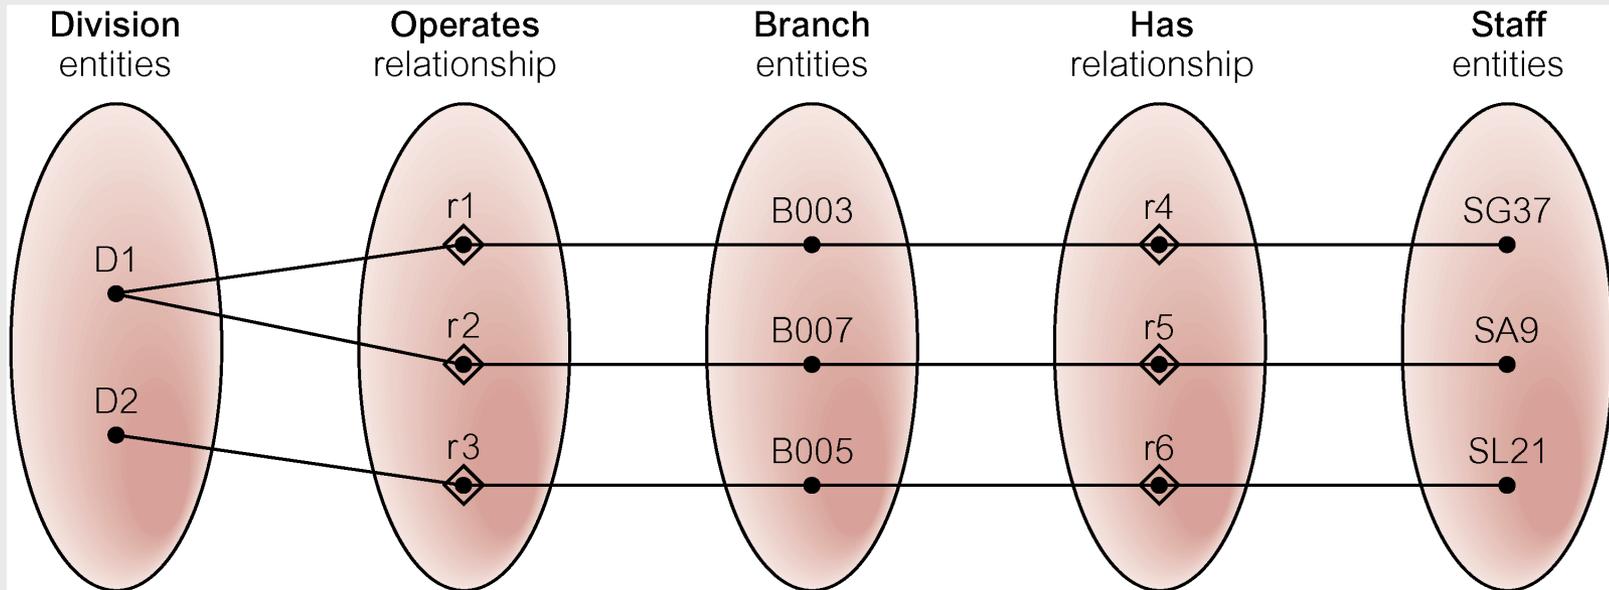

- ◆ **At which branch office does staff number SG37 work?**

# Restructuring ER model to remove Fan Trap

---

# Semantic Net of Restructured ER Model with Fan Trap Removed

◆ **SG37 works at branch B003.**

# Fan Trap Summary

---

- ◆ Where a model represents a relationship between entity types, but pathway creates a “choke point” that eliminates information
- ◆ Fan traps usually occur when there are multiple 1..\* relationships leaving an entity and at least one of the 1..\* relationships involves a transitive relationship
- ◆ The usual solution is to redirect the pathways so that the diagram shows only direct relationships rather than transitive relationships

# Chasm Trap

---

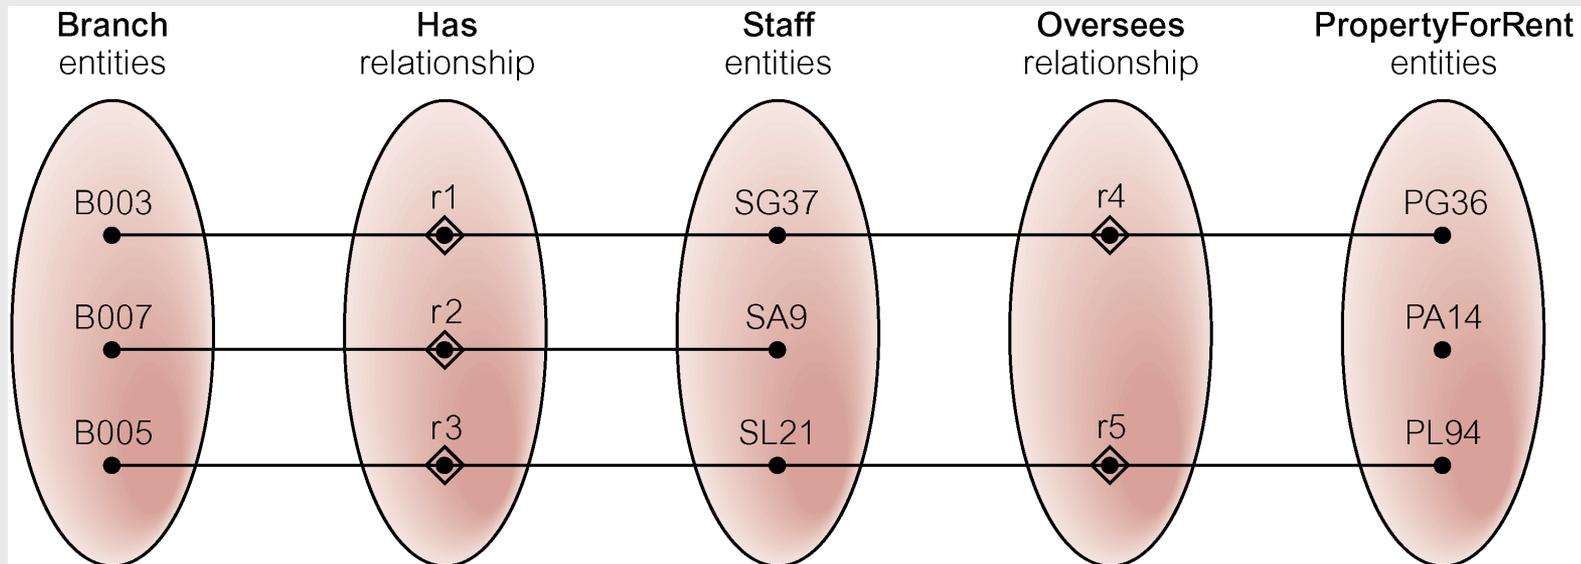

- ◆ **Where a model suggests the existence of a relationship between entity types, but pathway does not exist between certain entity occurrences.**
  - **There appears to be an unbroken path between two entities, but somewhere on that path there is a 0 participation rate**

# An Example of a Chasm Trap

---

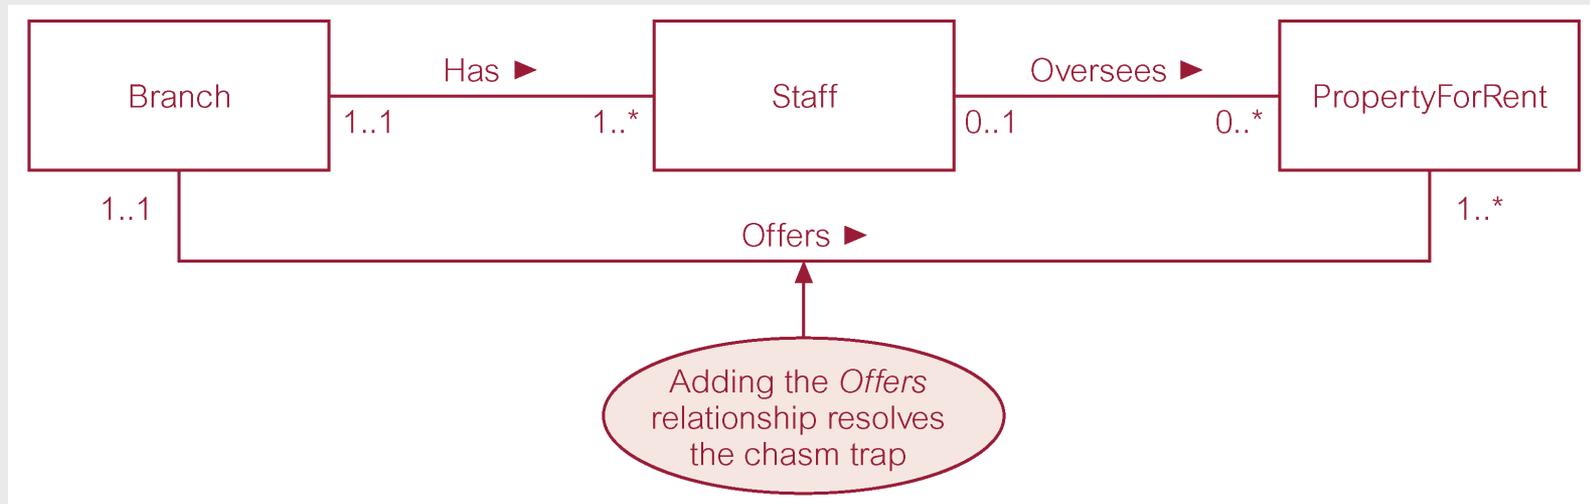

# Semantic Net of ER Model with Chasm Trap

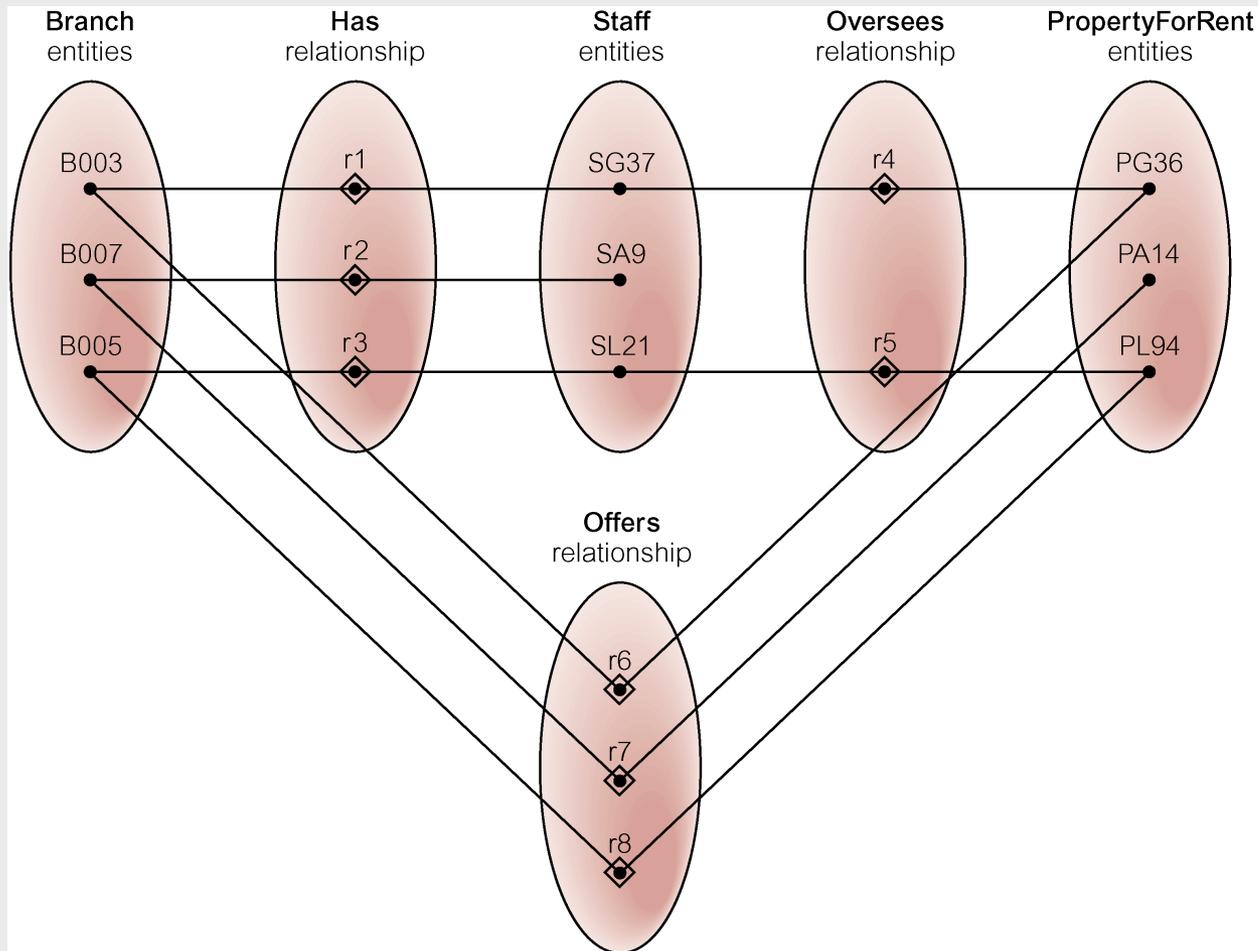

- ◆ **At which branch office is property PA14 available?**

# ER Model restructured to remove Chasm Trap

# Semantic Net of Restructured ER Model with Chasm Trap Removed

# Chasm Trap Summary

---

- ◆ **Occurs when an ER diagram suggests the existence of a transitive relationship between entity types, but the pathway does not always exist because somewhere on that path there is a 0 participation rate**
- ◆ **Ways to fix the trap**
  - **Add a direct relationship between the two entities that are disconnected by the trap—problem is that this solution adds redundant data to the database**
  - **Convince the customer to allow a default value so that the participation rate can be changed to 1**
