Solution of ECE 315 Test 4 F05

In each case circle the correct system characteristics. (In each case x is the excitation, y is the response and stable means BIBO stable.)

$$\mathbf{y}(t) = \begin{cases} 2\mathbf{x}(t) , \ \mathbf{x}(t) < -2 \\ \mathbf{x}(t) , \ -2 \le \mathbf{x}(t) \le 2 \\ 2\mathbf{x}(t) , \ \mathbf{x}(t) > 2 \end{cases}$$

| Non-Linear | $\mathbf{x}(t) = 1 \Rightarrow \mathbf{y}(t) = 1 \text{ and } \mathbf{x}(t) = 3 \Rightarrow \mathbf{y}(t) = 6.$ |
|----------------|---|
| | Not homogeneous, therefore non-linear. |
| Static | y(t) does not depend on x at any time other than t. |
| Stable | y(t) is never greater in magnitude than $2 x(t) $ |
| | so if x is bounded, y is also. |
| Invertible | For every $y(t)$ there is a unique $x(t)$ |
| Time Invariant | Shifting $x(t)$ in time shifts $y(t)$ by the same |
| | amount. |

$$\mathbf{y}[n] = \sqrt{\mathbf{x}[n]}$$

| Non-Linear | $x[n] = 4 \Rightarrow y[n] = 2 \text{ and } x[n] = 9 \Rightarrow y[n] = 3$ |
|----------------------------------|--|
| | Not homogeneous, therefore non-linear |
| Static | y[n] does not depend on x at any time other than n . |
| Stable | If x is bounded then so is y. |
| Non-Invertible | $ \mathbf{x}[n] = \mathbf{y}^2 \Rightarrow \mathbf{x}[n] = \pm \mathbf{y}^2$. Sign of x is |
| | indeterminate and two different x's yield the same y. |
| Time Invariant | Shifting $x[n]$ in time shifts $y[n]$ by the same |
| | amount. |
| $\mathbf{v}[n] = \mathbf{x}[3n]$ | |
| | |
| Linear | Multiplying x by any constant multiplies y by the |
| | same constant. Adding two signals causes a response |
| | which is the sum of the responses to the two individual |
| | signals. |
| Dynamic | y[1] depends on $x[3]$ which occurs at a time other |
| | than $n = 1$, therefore dynamic. |

| Stable | The values of y come directly from the values of x |
|--|--|
| | so if x is bounded, so is y. |
| Non-Invertible | \boldsymbol{x} is decimated to form $\boldsymbol{y}.$ Therefore the values of \boldsymbol{x} |
| | lost in decimation cannot be recovered simply by |
| | knowing y. |
| Time Variant | $\mathbf{x}_{1}[n] = \mathbf{g}[n] \Longrightarrow \mathbf{y}_{1}[n] = \mathbf{g}[3n]$ |
| $\mathbf{x}_{2}[n] = \mathbf{g}[n-n_{0}] \Longrightarrow \mathbf{y}$ | $y_{2}[n] = g[3n - n_{0}] \neq y_{1}[n - n_{0}] = g[3(n - n_{0})]$ |
| | |

y''(t) - 2y'(t) + 5y(t) = 4x(t)

| Linear | Differential equation in which each derivative of the |
|----------------|--|
| | response is raised to the first power and excitation is |
| | also and the coefficients are all constants. |
| Dynamic | Differential equation. |
| Unstable | Eigenvalues are $1 \pm j2$. Real parts are non- |
| | negative. |
| Invertible | $\mathbf{x}(t) = (1/4) \big[\mathbf{y}''(t) - 2 \mathbf{y}'(t) + 5 \mathbf{y}(t) \big]$ |
| Time Invariant | Standard differential equation form with no multiplications of derivatives by any functions of time. |

$$y''(t) + 2y'(t) + 5y(t) = 4x(t)$$

| Linear | Differential equation in which each derivative of the |
|----------------|--|
| | response is raised to the first power and excitation is |
| | also and all coefficients are constant. |
| Dynamic | Differential equation. |
| Stable | Eigenvalues are $-1 \pm j2$. Real parts are negative. |
| Invertible | x(t) = (1/4)[y''(t) - 2y'(t) + 5y(t)] |
| Time Invariant | Standard differential equation form with no multiplications of derivatives by any functions of time. |
| | |

$$\mathbf{y}(t) = \begin{cases} -10 & , \ \mathbf{x}(t-1) < -2 \\ \mathbf{x}(t-1) & , \ -2 \le \mathbf{x}(t-1) \le 2 \\ 10 & , \ \mathbf{x}(t-1) > 2 \end{cases}$$

| Non-Linear | $\mathbf{x}(t-1) = 4 \Rightarrow \mathbf{y}(t) = 10$ and |
|------------|---|
| | $x(t-1) = 6 \Rightarrow y(t) = 10$. Not homogeneous, therefore |
| | non-linear. |
| Dynamic | y(t) depends on x at a time other than t. |

| Stable | y(t) cannot exceed 10 in magnitude for any $x(t)$ |
|----------------|---|
| Non-Invertible | If $y(t) = 10$ or $y(t) = -10$ it is impossible to |
| | determine $x(t)$ because multiple x's cause the same y. |
| Time Invariant | Shifting $x(t)$ in time shifts $y(t)$ by the same |
| | amount. |
